Searches for new phenomena with the CMS detector (not Dark Matter)

Wednesday, 28 August 2019 11:30 (30 minutes)

CMS, as one of the two LHC muti-purpose experiments, has recorded a large amount of pp-collision data at sqrt(s)=13 TeV in Run-2. This unprecendented dataset is used to search for new physics in a large variety of final states.Heavy vector bosons are predicted by many models and serve as a candle for high-pT physics.Leptoquarks are a potential explaination for the observations in the flavour sector. Unusual signatures, such as displaced or delayed particles, allow to increase the access to models.This presentation reviews the latest results from new physics searches with CMS.
