

## Contribution of minijets to the elliptic flow

*Tuesday 17 August 2010 10:20 (40 minutes)*

### Summary

At the LHC we expect very large number of minijets to be produced in nuclear collisions. They traverse the bulk deconfined medium and deposit energy and momentum there. I shall discuss whether or not the deposited momentum can contribute to collective flow and its anisotropy and shall estimate the effect on  $v_2$ .
