Displaced Heavy Neutrinos at the LHC and Beyond

Tuesday 23 April 2019 18:10 (15 minutes)

We investigate the pair production of right-handed neutrinos from the decay of the additional neutral gauge boson Z' at a gauged $B - L$ model. Analysing such signal can be recasted from dark photon searches with a corresponding factor of its coupling g' , this gives a upper bound for g' to be 10^{-4} for $m_{Z'}$ under 10 GeV and 10^{-3} for $m_{Z'}$ beyond 10 GeV. As the heavy neutrinos can be longlived as distinctive displaced vertices signatures via seesaw mechanism, an simulation based on Monte Carlo event generator is performed, which shows a sensitivities for $V_{\mu N} < 10^{-5}$ with 300 fb^{-1} assuming $g' = 10^{-3}$ and $M_N = 0.3 \cdot m_{Z'}$ at MAPP and LHCb detector.
