

Recent results of many-body baryonic B decays from Belle

M.-Z. Wang
on behalf of the Belle Collaboration
2019/2/10-2019/2/16

● Introduction

$$\bullet B^+ \rightarrow p \bar{\Lambda} K^+ K^-$$

$$B^+ \rightarrow \bar{p} \Lambda K^+ K^+$$

charge conjugate
modes included

● Summary

Motivations for $B \rightarrow p\bar{\Lambda}KK$

- $b \rightarrow s$ penguin loop probes new physics due to new heavy particle's contribution
- Most baryonic B decays show threshold enhancement and angular asymmetry
- Hierarchical structure

$$\mathcal{B}(B^0 \rightarrow p\Lambda_c^- \pi^+ \pi^-) > \mathcal{B}(B^+ \rightarrow p\bar{\Lambda}_c^- \pi^+) > \mathcal{B}(B^0 \rightarrow p\bar{\Lambda}_c^-)$$

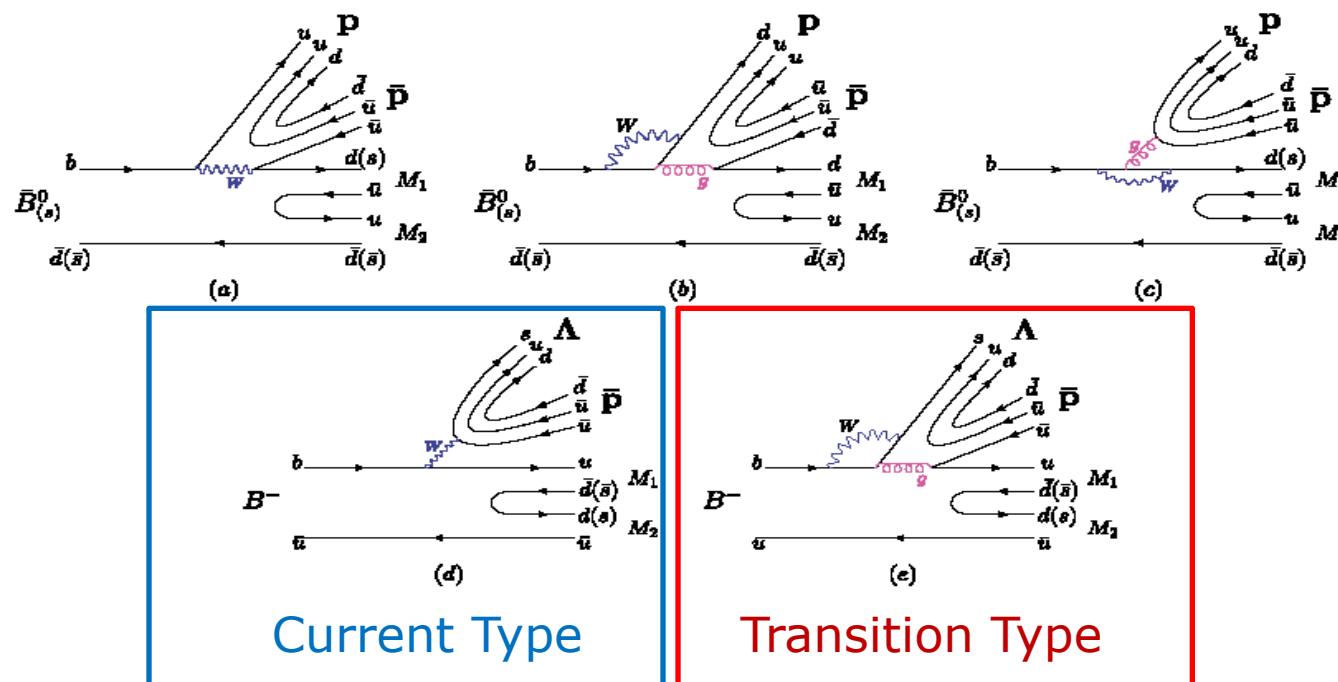

A. J. Bevan *et al.*, *The Physics of the B Factories* EPJ C74:3026 (2014)

- Evidence of CP violation in baryonic B decays

KEKB factory and data sample

- An asymmetric energy e^+e^- collider at KEK.
- LER(e^+): 3.5 GeV
HER(e^-): 8 GeV
Crossing angle: ± 11 mrad
- Target: $e^+e^- \rightarrow \Upsilon(4S) \rightarrow B\bar{B}$
- Main background: $e^+e^- \rightarrow q\bar{q}$ ($q = u, d, s, c$) with about 3 times larger cross section.
- The CM energy of e^+e^- are set to be $\Upsilon(4S)$ resonance

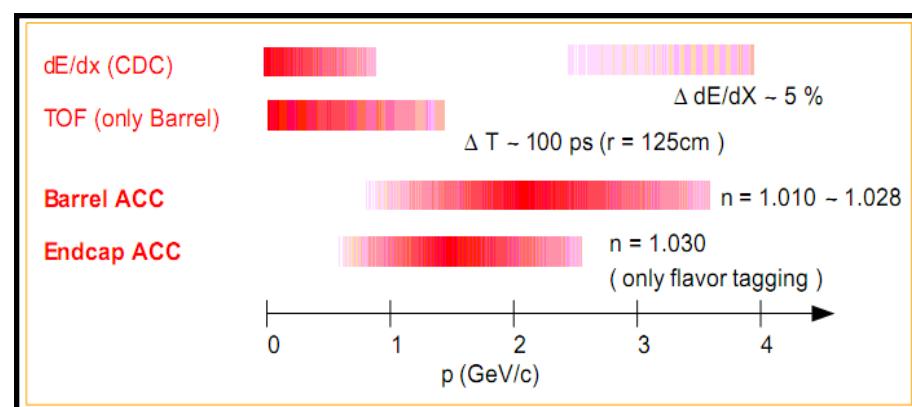

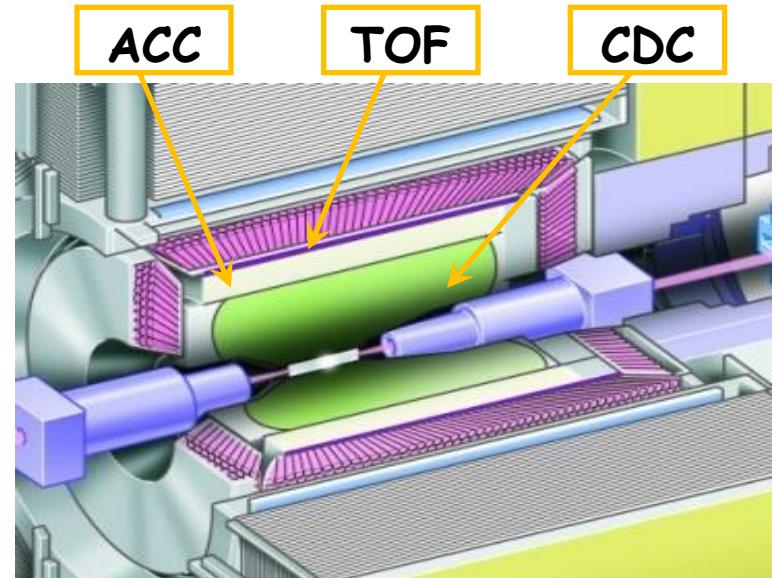

Integrated luminosity of B factories

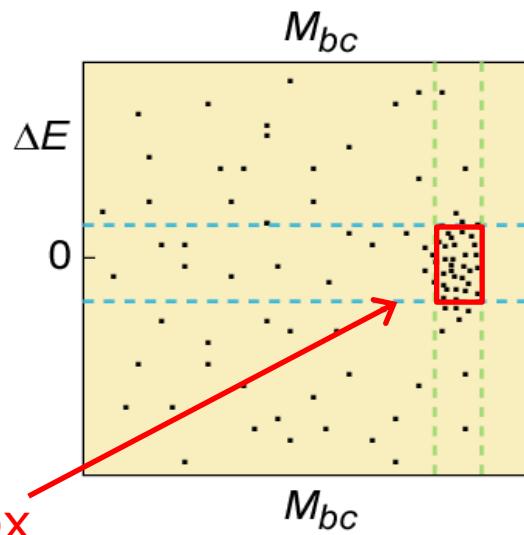

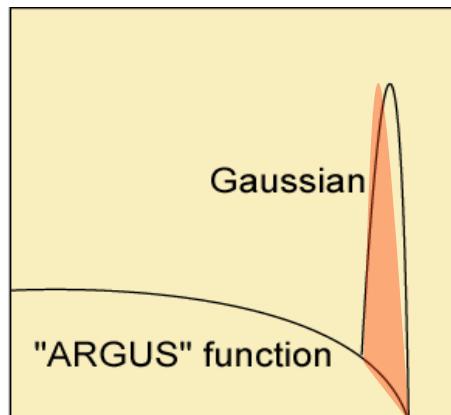

Particle Identification at Belle

- **Charged particle:** e, μ, π, K, p
 - **ACC:** Silica aerogel for Cerenkov light detected by FM-PMT
 - **TOF:** Plastic scintillator with Timing resolution ~ 100 ps
 - **CDC:** Wire drift chamber with He/C_2H_6 for $dE/dx, p_t$, and p_z of charged track
 - $\mathcal{L}_i = \mathcal{L}_i^{CDC} \times \mathcal{L}_i^{TOF} \times \mathcal{L}_i^{ACC}$
- **ECL:** Calorimeter cluster information for e, γ , and $\pi^0 \rightarrow \gamma\gamma$
- **KLM:** Information for K_L^0 and μ
- $K_S^0 \rightarrow \pi^+ \pi^-$
- $\Lambda \rightarrow p \pi^-$
- $\gamma \rightarrow e^+ e^-$

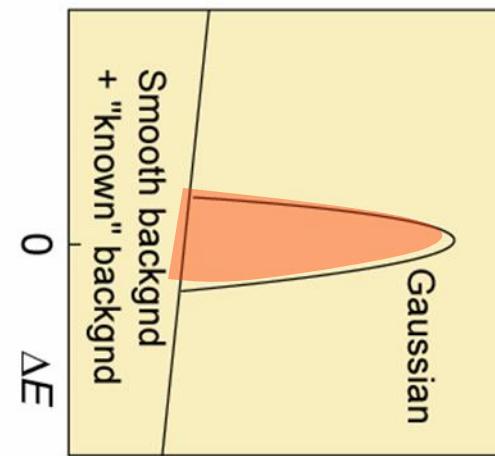

B Signal Reconstruction

$$BF = N_{\text{sig}} / \epsilon / N_{\text{BB}}$$

Signal Box

$$\Delta E = E(\text{B cand.}) - E_{beam}$$

$$M_{bc} = \sqrt{E_{beam}^2 - P(\text{B cand.})^2}$$

(all in CM frame)

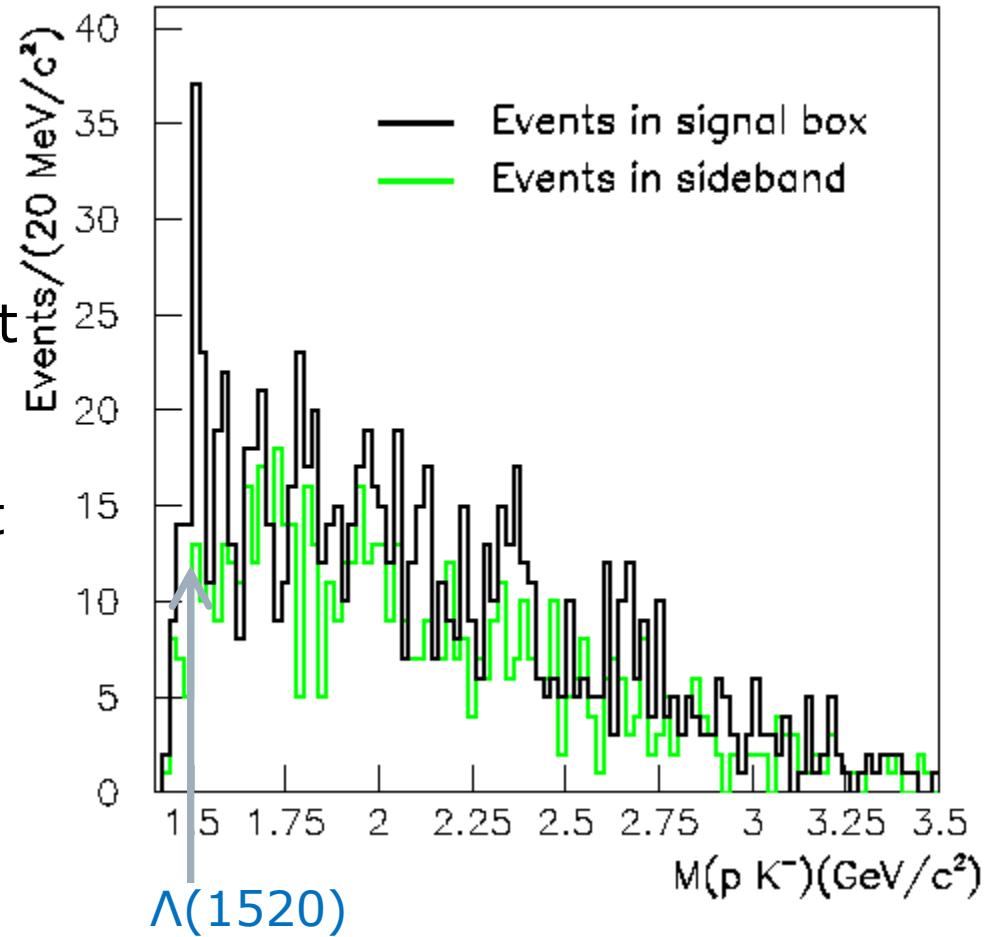

Intermediate resonances

Found many intermediate Resonances:

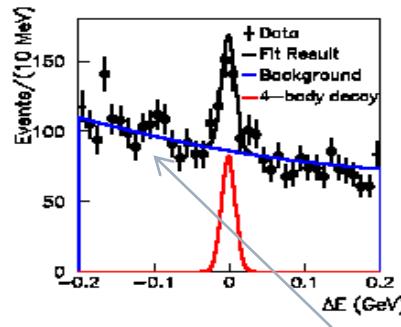

$J/\psi \eta_c \chi_c$ in $p\bar{\Lambda} K^-$ mass plot
 $\bar{p}\Lambda K^+$

Φ in K^+K^- mass plot

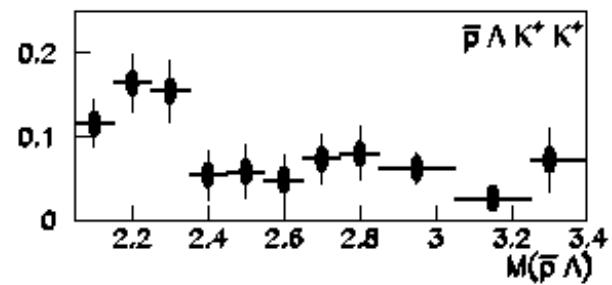

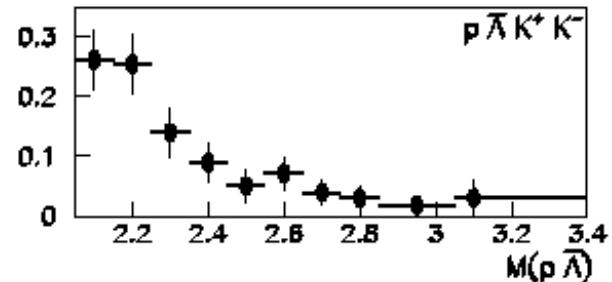

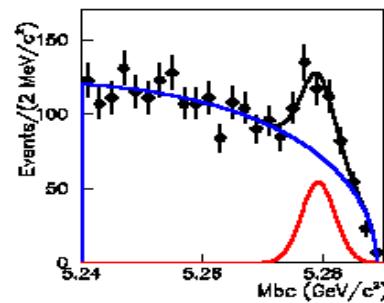

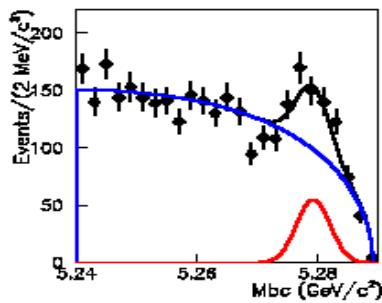

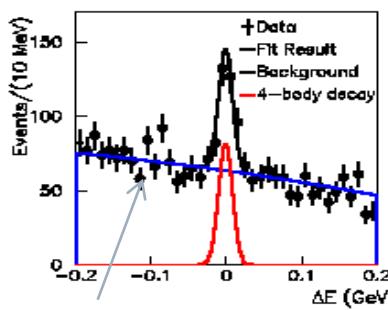

$\Lambda(1520)$ in pK^- mass plot

Vetoing all visible resonances

$\Sigma^0 \rightarrow \Lambda\gamma$

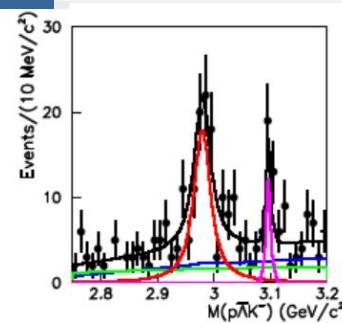

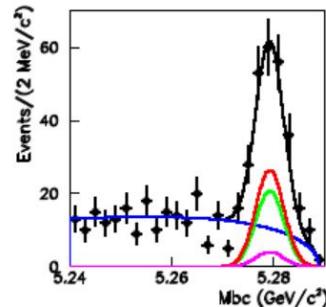

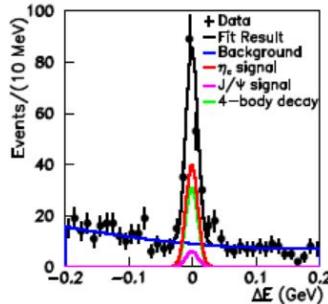

threshold effect observed

$J/\psi \rightarrow \Lambda(1520)\bar{\Lambda} + \text{c.c.}$	$< 1.80 \times 10^{-3}$	
$B^+ \rightarrow \bar{\Lambda}(1520)\Lambda K^+$	$< 2.08 \times 10^{-6}$	

Summary

- Many more baryonic B decays are observed and a generalized factorization picture can describe data
- Threshold effect persists
- Three-body Baryonic decays could be useful to understand the charmonium system
- Many less significant decays will be measured in the near future with super B factories
