Next-to-leading power corrections for Drell-Yan and prompt photon production
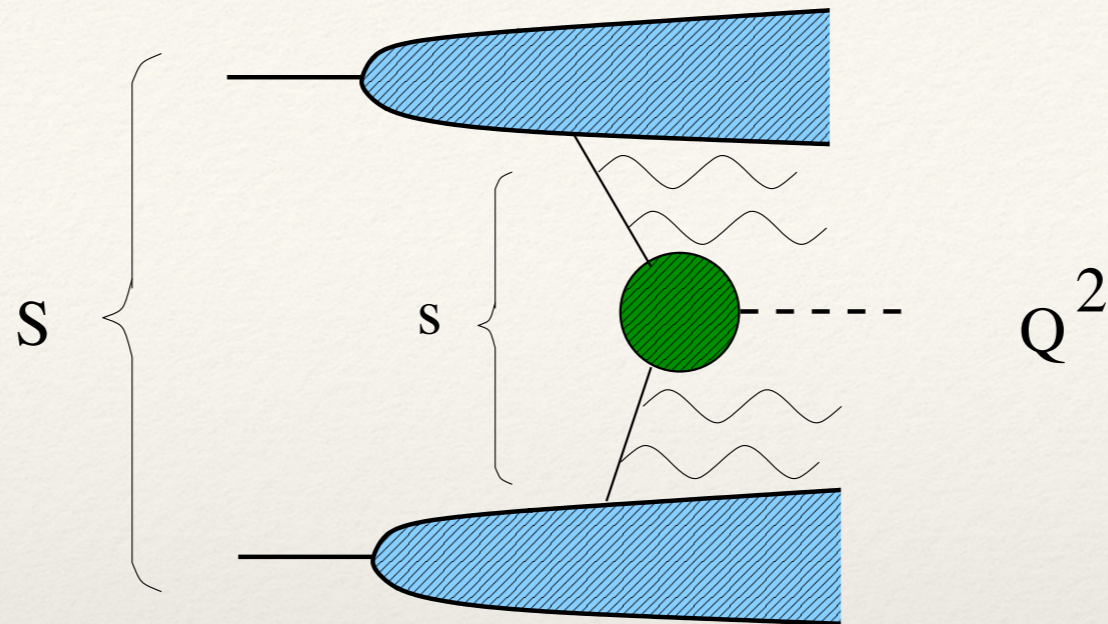

Eric Laenen

UNIVERSITEIT VAN AMSTERDAM

Nik|hef

Universiteit Utrecht

Outline

- Next-to-leading power threshold logarithms

  - Regions, factorization at NNLO

- NLP logs at NLO, simple formula

  - extension to prompt photon

- LL resummation at NLP

  - using NLP webs

Threshold logarithms

Log of "energy excess above production threshold"

$$S \geq s \geq Q^2$$

$$L^2 = \ln\left(1 - \frac{Q^2}{s}\right) \equiv \ln^2(1 - z)$$

NLP threshold behavior

✦ For Drell-Yan, DIS, Higgs, singular behavior in perturbation theory when $z \to 1$

$$\delta(1-z) \qquad \left[\frac{\ln^i(1-z)}{1-z}\right]_+ \qquad \boxed{\ln^i(1-z)}$$

  ‣ plus distributions have been organized to all orders (="resummation"), also possible for ln(1-z)?

✦ "Zurich" method of threshold expansion allows computation (for NNNLO Higgs production)

$$(1-z)^p \, \ln^q(1-z)$$

Anasthasiou, Duhr, Dulat, Furlan, Gehrmann, Herzog, Mistlberger

  – done to p=37..

Larkoski, Neill, Stewart, Moult, Kolodrubetz, Rothen, Zhu, Tackmann, Vita, Feige ; Beneke, Campanario, Mannel, Peckja

✦ Much development in SCET

✦ Useful also for improving NNLO slicing (N-jettiness) methods

✦ Alternative terminology to "NLP"

  ‣ Next-to-soft

  ‣ Next-to-eikonal

PARTICLEFACE workshop on NLP, Nov. 2018
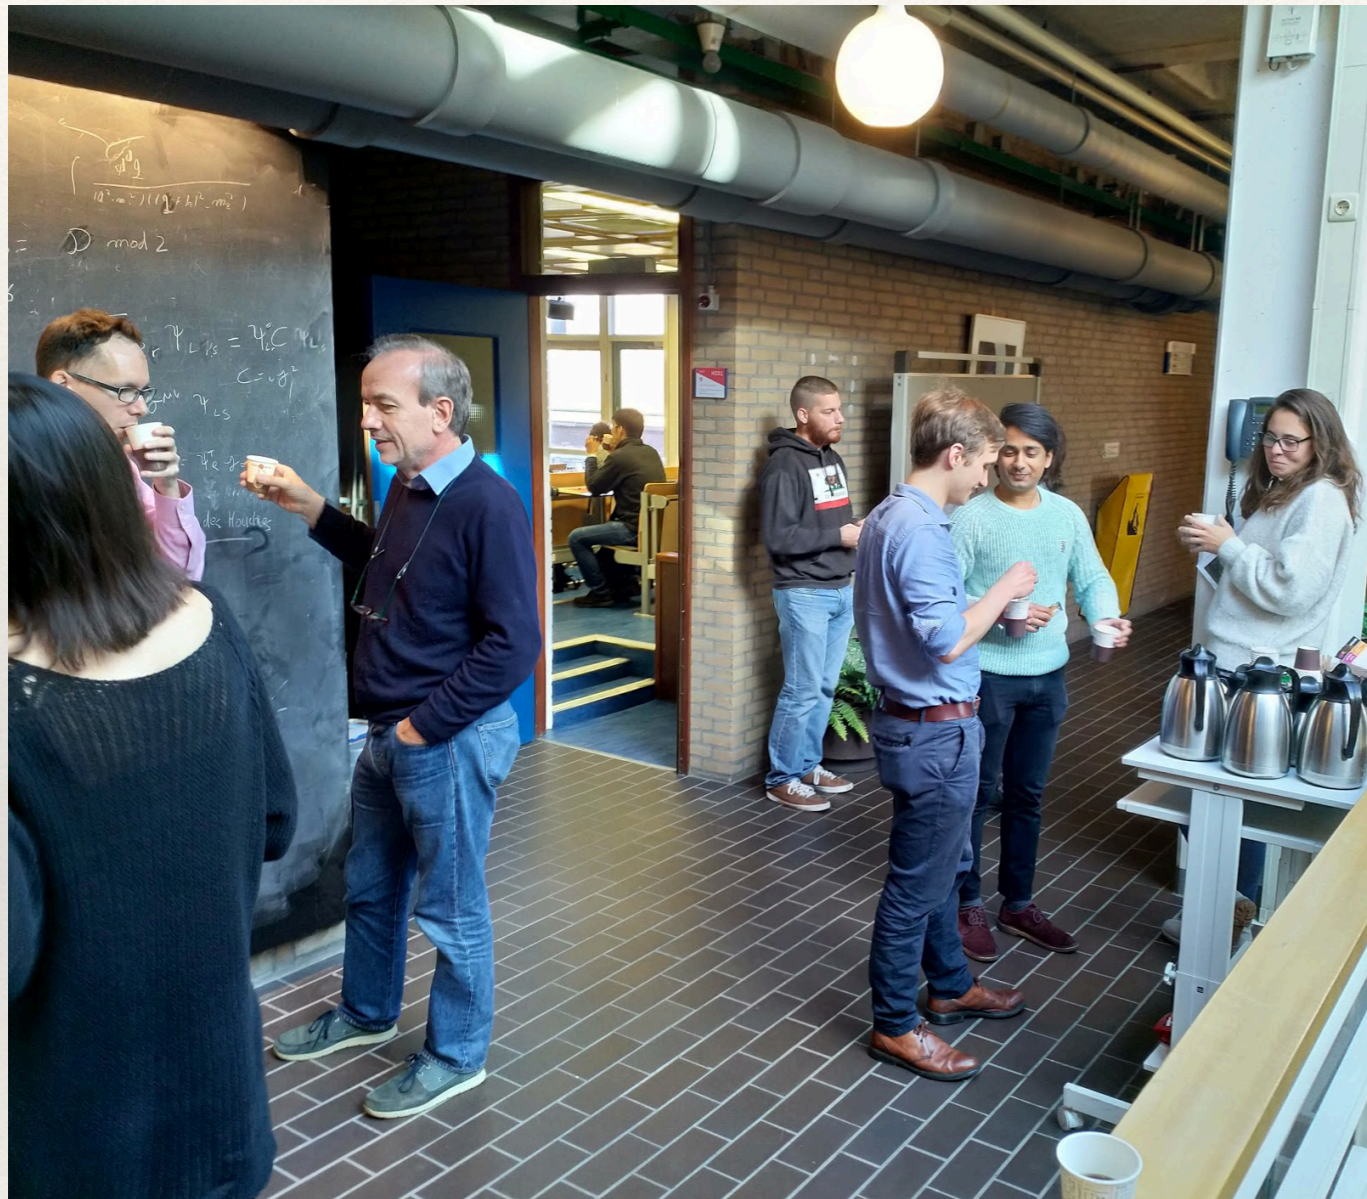

Next-to-eikonal Feynman rules

✦ Keep 1 term more in k expansion beyond eikonal approximation

$$\text{scalar}: \quad \frac{2p^\mu + k^\mu}{2p \cdot k + k^2} \longrightarrow \frac{2p^\mu}{2p \cdot k} + \frac{k^\mu}{2p \cdot k} - k^2 \frac{2p^\mu}{(2p \cdot k)^2}$$

$$\text{fermion}: \quad \frac{\slashed{p} + \slashed{k}}{2p \cdot k + k^2} \gamma^\mu u(p) \longrightarrow \left[\frac{2p^\mu}{2p \cdot k} + \frac{\slashed{k}\gamma^\mu}{2p \cdot k} - k^2 \frac{2p^\mu}{(2p \cdot k)^2} \right] u(p)$$

▸ Becomes emitter-spin dependent, recoil now included

▸ Is there predictive power for the next-to-eikonal terms?

Eikonal term

Classic NLP result: Low's theorem

✦ These rules are good for emissions from external lines. At NLP order, also 1 "internal" emission contributes

$$\Gamma^\mu \;=\; \bigcirc\!H \;+\; \bigcirc\!H \;+\; \bigcirc\!H$$

✦ Low's theorem (scalars, generalization to spinors by Burnett-Kroll, to massless particles by Del Duca): **LBKD theorem**

    ✓ Work to order k, and use Ward identity

$$\Gamma^\mu = \left[\frac{(2p_1 - k)^\mu}{-2p_1 \cdot k} + \frac{(2p_2 + k)^\mu}{2p_2 \cdot k}\right]\Gamma + \left[\frac{p_1^\mu(k \cdot p_2 - k \cdot p_1)}{p_1 \cdot k} + \frac{p_2^\mu(k \cdot p_1 - k \cdot p_2)}{p_2 \cdot k}\right]\frac{\partial\Gamma}{\partial p_1 \cdot p_2}$$

✦ Elastic amplitude still determines the emission to NLP accuracy,

    ‣ note the derivative

   ‣ detailed knowledge of "internal part" not needed

NLP logarithms for Drell–Yan

✦ Goal: combine (N)LP matrix elements with (N)LP phase space to **predict** $\ln^i(1-z)$ for NNLO Drell-Yan

$$\frac{1}{\sigma^{(0)}}\frac{d\hat{\sigma}}{dz} \sim \int d\Phi_{\mathrm{LP}}|\mathcal{M}|^2_{\mathrm{LP}} + \int d\Phi_{\mathrm{LP}}|\mathcal{M}|^2_{\mathrm{NLP}} + \int d\Phi_{\mathrm{NLP}}|\mathcal{M}|^2_{\mathrm{LP}} + \dots$$

‣ We pursue two methods:

  ✓ 1. Method of regions

  ✓ 2. Factorization

‣ NLO is "easy", real test at NNLO

NLP logs in Drell-Yan at NNLO

✦ **Check NLP Feynman rules for NNLO Drell-Yan *double real* emission**

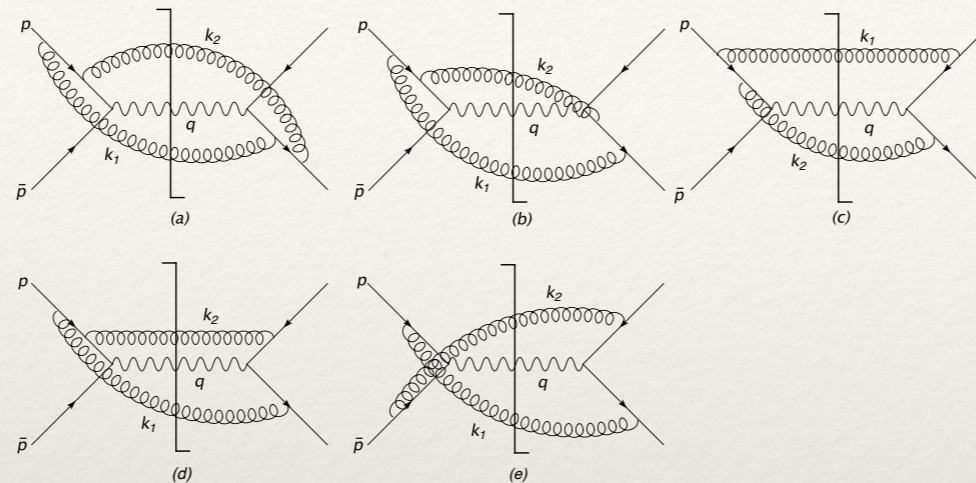

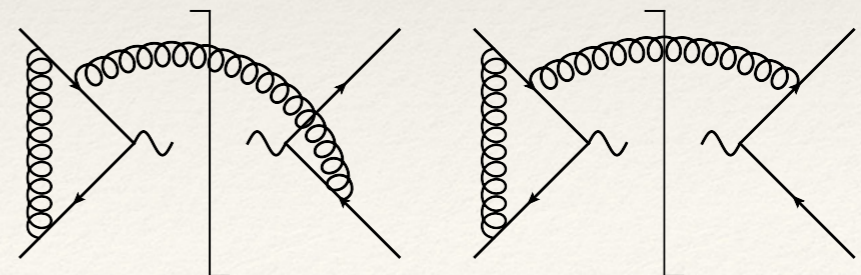

▸ **Result at NLP level, agrees with equivalent exact result. C_F^2 terms e.g.**

$$K_{\text{NE}}^{(2)}(z) = \left(\frac{\alpha_s}{4\pi}C_F\right)^2 \left[-\frac{32}{\epsilon^3}\mathcal{D}_0(z) + \frac{128}{\epsilon^2}\mathcal{D}_1(z) - \frac{128}{\epsilon^2}\log(1-z)\right.$$

$$-\frac{256}{\epsilon}\mathcal{D}_2(z) + \frac{256}{\epsilon}\log^2(1-z) - \frac{320}{\epsilon}\log(1-z)$$

$$\left.+\frac{1024}{3}\mathcal{D}_3(z) - \frac{1024}{3}\log^3(1-z) + 640\log^2(1-z)\right],$$

$$\mathcal{D}_i = \left[\frac{\log^i(1-z)}{1-z}\right]_+$$
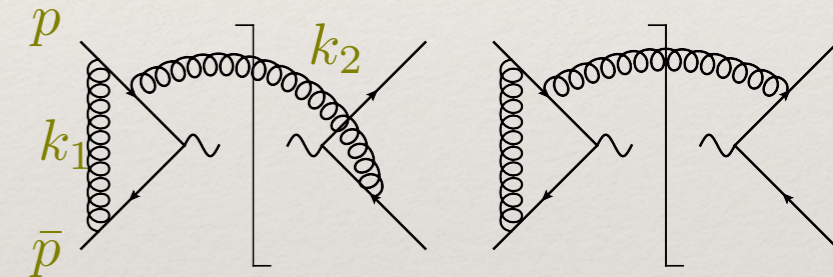

✦ **Next, 1 Real- 1 Virtual**

Diagnosis: method of regions

Beneke, Smirnov

✦ How does it work?

  ‣ Divide up k_1 (=loop-momentum) integral into hard, 2 collinear and a soft region, by appropiate scaling

$$\text{Hard}: \quad k_1 \sim \sqrt{\hat{s}}\,(1,1,1)\,; \qquad \text{Soft}: \quad k_1 \sim \sqrt{\hat{s}}\,(\lambda^2,\lambda^2,\lambda^2)\,;$$

$$\text{Collinear}: \quad k_1 \sim \sqrt{\hat{s}}\,(1,\lambda,\lambda^2)\,; \quad \text{Anticollinear}: \quad k_1 \sim \sqrt{\hat{s}}\,(\lambda^2,\lambda,1)\,.$$

  ‣ expand integrand in λ, to leading and next-to-leading order

  ‣ but then integrate over *all* k_1 anyway!

  ‣ Treat emitted momentum as soft and incoming momenta as hard

$$k_2^\mu = (\lambda^2, \lambda^2, \lambda^2)$$

Method of region result

- **Results**   Bonocore, EL, Magnea, Vernazza, White

  - Hard region (expansion in λ^2):   *LP + some NLP*

  - Soft region (expansion in λ^2):   *ZERO*

  - (anti-)collinear regions (expansion in λ):   *NLP only*

- Result:

  - the full $K^{(1)}_{1r,1v}$ is reproduced, including constants

- For **predictive power**, need factorization

A factorization approach from Low's theorem

Bonocore, EL, Magnea, Melville, Vernazza, White

✦ Can we *predict* the ln(1-z) logarithms from lower orders?

  ‣ Factorize the cross section,

    ✓ H: the hard and the soft function

    ✓ J: incoming-jet functions

✦ Next, add one extra soft emission. Let every blob radiate!

Del Duca

  ‣ Compute each new "blob + radiation", and put it together. New: **radiative jet function**

$$J_\mu\left(p, n, k, \alpha_s(\mu^2), \epsilon\right) u(p) = \int d^d y \, e^{-i(p-k)\cdot y} \langle 0 | \, \Phi_n(y, \infty) \, \psi(y) \, j_\mu(0) \, | p \rangle$$

Factorization approach to NLP logarithms

✦ Upshot: a factorization formula for the emission amplitude

$$\mathcal{A}_{\mu,a}(p_j,k) = \sum_{i=1}^{2} \left(\frac{1}{2}\, \widetilde{\mathcal{S}}_{\mu,a}(p_j,k) + g\,\mathbf{T}_{i,a}\, G_{i,\mu}^{\nu}\, \frac{\partial}{\partial p_i^{\nu}} + J_{\mu,a}\,(p_i,n_i,k) \right) \mathcal{A}(p_j) - \mathcal{A}_{\mu,a}^{\widetilde{\mathcal{J}}}(p_j,k)$$

Soft function   Orbital term   Jet function   Overlap

▸ J_μ is needed at one-loop level

Predicted NLP threshold logs vs exact result

✦ Compute blobs, one-loop radiative jet function, contract with cc amplitude and integrate over phase space. Exact calculation gives

$$
\begin{aligned}
K_{\mathrm{rv}}^{(2)}(z) \;=\;& \left(\frac{\alpha_s}{4\pi}\right)^2 \Bigg\{ C_F^2 \left[\frac{32\mathcal{D}_0(z) - 32}{\epsilon^3} + \frac{-64\mathcal{D}_1(z) + 48\mathcal{D}_0(z) + 64L(z) - 96}{\epsilon^2} \right. \\
& + \frac{64\mathcal{D}_2(z) - 96\mathcal{D}_1(z) + 128\mathcal{D}_0(z) - 64L^2(z) + 208L(z) - 196}{\epsilon} - \frac{128}{3}\mathcal{D}_3(z) \\
& \left. + 96\mathcal{D}_2(z) - 256\mathcal{D}_1(z) + 256\mathcal{D}_0(z) + \frac{128}{3}L^3(z) - 232L^2(z) + 412L(z) - 408 \right] \\
& + C_A C_F \left[\frac{8\mathcal{D}_0(z) - 8}{\epsilon^3} + \frac{-32\mathcal{D}_1(z) + 32L(z) - 16}{\epsilon^2} + \frac{64\mathcal{D}_2(z) - 64L^2(z) + 64L(z) + 20}{\epsilon} \right. \\
& \left. - \frac{256}{3}\mathcal{D}_3(z) + \frac{256}{3}L^3(z) - 128L^2(z) - 60L(z) + 8 \right] \Bigg\},
\end{aligned}
\tag{4.6}
$$

$$
L(z) = \ln(1 - z)
$$

✦ **Result**: *perfect agreement* for 4 powers of the next-to-eikonal/soft logarithms at NNLO

$$
\ln^3(1 - z), \quad \ln^2(1 - z), \quad \ln^1(1 - z), \quad \ln^0(1 - z),
$$

Colour-singlet final states

- Generalize NLP factorization (the LBKD theorem) beyond Drell-Yan, to arbitrary colour-singlet final states

  - look at NLO only, i.e. predict

    $$D_1 = \left[\frac{\ln(1-z)}{1-z}\right]_+ \qquad D_0 = \left[\frac{1}{1-z}\right]_+ \qquad L_1 = \ln(1-z) \qquad L_0 = \ln^0(1-z)$$

    - ✓ where "1-z" can take different forms for 2 -> 2,3 etc scattering

  - apply to Drell-Yan, (multi-)Higgs, (vector boson pairs)

  - for inclusive and fully differential cross sections

NLP terms in colorless final states @NLO

✦ Previous factorization at NLO

$$\mathcal{A}_{\mu,a}^{(1)}\left(\{p_i\},k\right) = \sum_{l=1}^{2}\left[g_s\,\mathbf{T}_{l,a}\,G_{l,\mu}^{\nu}\,\frac{\partial}{\partial p_l^{\nu}} + J_{\mu,a}^{(1)}\left(p_l,n_l,k\right)\right]\mathcal{A}^{(0)}\left(\{p_i\}\right)$$

✓ G is a projector, **T** a color matrix

▸ initial quarks: $\quad J_{\mu}^{a}(p,n,k) = g_s\mathbf{T}^a\left[\dfrac{(2p-k)_{\mu}}{2p\cdot k} + \dfrac{\mathrm{i}k^{\beta}}{p\cdot k}\,S_{\beta\mu}\right]\quad S_{\beta\mu} = \dfrac{\mathrm{i}}{4}\left[\gamma_{\beta},\gamma_{\mu}\right]$

▸ initial gluons: $\quad J_{\mu,\rho\sigma}^{a}(p,n,k) = g_s\mathbf{T}^a\left[\dfrac{(2p-k)_{\mu}}{2p\cdot k}\,\eta_{\rho\sigma} - \dfrac{\mathrm{i}k^{\beta}}{p\cdot k}\,M_{\beta\mu,\rho\sigma}\right]\quad M_{\beta\mu,\rho\sigma} = \mathrm{i}\left(\eta_{\beta\rho}\eta_{\mu\sigma} - \eta_{\beta\sigma}\eta_{\mu\rho}\right)$

▸ notice the spin-dependent Lorentz generator ("next-to-soft theorem")

▸ notice derivative term (Low's theorem)

Lorentz generator

✦ The derivative term can be written as the **orbital part** of Lorentz generator

$$G^{\nu}_{l,\mu} \frac{\partial}{\partial p^{\nu}_l} = \frac{k^{\nu}}{p_l \cdot k} \left[p_{l,\nu} \frac{\partial}{\partial p^{\mu}_l} - p_{l,\mu} \frac{\partial}{\partial p^{\nu}_l} \right] = - \frac{\mathrm{i} k^{\nu} \, \mathrm{L}^{(l)}_{\nu\mu}}{p_i \cdot k}$$

✦ so that

$$\mathcal{A}^{(1)}_{\mu,a} (\{p_i\}, k) = \sum_{l=1}^{2} g_s \, \mathbf{T}_{l,a} \left[\frac{(2p_l - k)_{\mu}}{2p_l \cdot k} - \frac{\mathrm{i} k^{\nu}}{p_l \cdot k} \underbrace{\left(\mathrm{L}^{(l)}_{\nu\mu} + \Sigma^{(l)}_{\nu\mu} \right)}_{\mathrm{J}^{(l)}_{\nu\mu}} \right] \mathcal{A}^{(0)} (\{p_i\})$$

$$= \sum_{l=1}^{2} g_s \, \mathbf{T}_{l,a} \left[\frac{p_{l,\mu}}{p_l \cdot k} - \frac{\mathrm{i} k^{\nu} \, \mathrm{J}^{(l)}_{\nu\mu}}{p_l \cdot k} \right] \mathcal{A}^{(0)} (\{p_i\})$$

▸ leads to   Scalar + Orbital + Spin   part of the NLP amplitude

Colour singlet production in gg channel

✦ **Square amplitude**

$$|\mathcal{A}_{\mathrm{NLP}}|^2 = \sum_{\mathrm{colours}} \left(\mathcal{A}^{\sigma_1, \mu_1\nu_1}_{\mathrm{scal.}} + \mathcal{A}^{\sigma_1, \mu_1\nu_1}_{\mathrm{spin}} + \mathcal{A}^{\sigma_1, \mu_1\nu_1}_{\mathrm{orb.}} \right)^* \mathcal{P}_{\mu_1\mu_2}(p_1, l_1) \mathcal{P}_{\nu_1\nu_2}(p_2, l_2) \mathcal{P}_{\sigma_1\sigma_2}(k, l_3)$$

$$\times \left(\mathcal{A}^{\sigma_2, \mu_2\nu_2}_{\mathrm{scal.}} + \mathcal{A}^{\sigma_2, \mu_2\nu_2}_{\mathrm{spin}} + \mathcal{A}^{\sigma_2, \mu_2\nu_2}_{\mathrm{orb.}} \right), \tag{3.7}$$
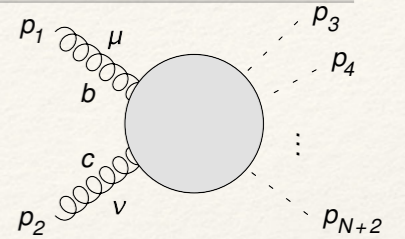

✓ where
$$\mathcal{P}_{\alpha\beta}(p, l) \equiv \sum_\lambda \epsilon^{(\lambda)}_\alpha(p) \, \epsilon^{(\lambda)*}_\beta(p) = -\eta_{\alpha\beta} + \frac{p_\alpha l_\beta + p_\beta l_\alpha}{p \cdot l}$$

▸ **Can be done using -$\eta_{\alpha\beta}$ only (external ghosts are beyond NLP)**

▸ **Truncate to NLP, leads to**

$$|\mathcal{A}_{\mathrm{NLP}}|^2 = \sum_{\mathrm{colours}} \left\{ \left| \mathcal{A}^{\sigma, \mu\nu}_{\mathrm{scal.}} \right|^2 + 2\mathrm{Re}\left[\left(\mathcal{A}^{\sigma, \mu\nu}_{\mathrm{spin}} + \mathcal{A}^{\sigma, \mu\nu}_{\mathrm{orb.}} \right)^* \mathcal{A}_{\mathrm{scal.}\, \sigma, \mu\nu} \right] \right\}$$

▸ **Easy part: scalar (eikonal) part**

$$\sum_{\mathrm{colours}} \left| \mathcal{A}^{\sigma, \mu\nu}_{\mathrm{scal.}} \right|^2 = 2g_s^2 N_c \left(N_c^2 - 1 \right) \frac{p_1 \cdot p_2}{p_1 \cdot k \, p_2 \cdot k} \left| \mathcal{A}_{\mu\nu} \right|^2$$

CS production in gg channel

- Spin * scalar vanishes (anti-symmetriy in μν)

- Orbital part leads to shifts in momentum dependence

$$\sum_{\text{colours}} 2\,\text{Re}\left[\mathcal{A}_{\text{orb.}}^{\sigma,\,\mu\nu}\,\mathcal{A}_{\text{scal.}\,\sigma,\,\mu\nu}\right] \;=\; \frac{2g_s^2 N_c\left(N_c^2-1\right)p_1\cdot p_2}{p_1\cdot k\,p_2\cdot k}\left[\delta p_1^\alpha\,\frac{\partial}{\partial p_1^\alpha}+\delta p_2^\alpha\,\frac{\partial}{\partial p_2^\alpha}\right]|\mathcal{A}_{\mu\nu}|^2$$
  - where

$$\delta p_1^\alpha \;=\; -\frac{1}{2}\left(\frac{p_2\cdot k}{p_1\cdot p_2}\,p_1^\alpha-\frac{p_1\cdot k}{p_1\cdot p_2}\,p_2^\alpha+k^\alpha\right),\;\; \delta p_2^\alpha \;=\; -\frac{1}{2}\left(\frac{p_1\cdot k}{p_1\cdot p_2}\,p_2^\alpha-\frac{p_2\cdot k}{p_1\cdot p_2}\,p_1^\alpha+k^\alpha\right)$$

- Result is simple: dipole times shifted squared LO amplitude

$$|\mathcal{A}_{\text{NLP}}|^2 \;=\; \frac{2g_s^2 N_c\left(N_c^2-1\right)p_1\cdot p_2}{p_1\cdot k\,p_2\cdot k}\,|\mathcal{A}_{\mu\nu}\left(p_1+\delta p_1, p_2+\delta p_2\right)|^2$$

CS production in qq̄ channel

✦ Scalar plus orbital part very similar to gg case

$$|A^\sigma_{\text{NLP}}|^2_{\text{scal.+orb.}} = \frac{g_s^2 C_F}{z} \frac{s}{p_1 \cdot k \, p_2 \cdot k} |A(p_1 + \delta p_1, p_2 + \delta p_2)|^2$$

▸ except for the 1/z , which is due to the kinematic shift

$$s \rightarrow (p_1 + p_2 + \delta p_1 + \delta p_2)^2 = s + 2(\delta p_1 + \delta p_2) \cdot (p_1 + p_2)$$

▸ which is the same as

$$s \rightarrow zs$$

✦ But the spin part now does not cancel:

$$\sum_{\text{colours}} 2\,\text{Re}\left[A^\dagger_{\text{scal.}} A_{\text{spin}}\right]_{\text{NLP}} = -g_s^2 N_c C_F \frac{2p_1 \cdot p_2}{p_1 \cdot k \, p_2 \cdot k} \underbrace{\frac{k \cdot (p_1 + p_2)}{p_1 \cdot p_2}}_{-(1-z)} |\mathcal{A}(p_1, p_2)|^2$$

▸ precisely compensates 1/z ≅ 1 + (1-z)!!

20

Squared amplitudes and cross sections

✦ In summary

▸ gluons
$$|\mathcal{A}_{\mathrm{NLP}}|^2 = \frac{2g_s^2 N_c \left(N_c^2 - 1\right) p_1 \cdot p_2}{p_1 \cdot k \, p_2 \cdot k} \left|\mathcal{A}_{\mu\nu}\left(p_1 + \delta p_1, p_2 + \delta p_2\right)\right|^2$$

▸ quarks
$$|A_{\mathrm{NLP}}|^2 = g_s^2 \, C_F \frac{s}{p_1 \cdot k \, p_2 \cdot k} \left|A(p_1 + \delta p_1, p_2 + \delta p_2)\right|^2$$
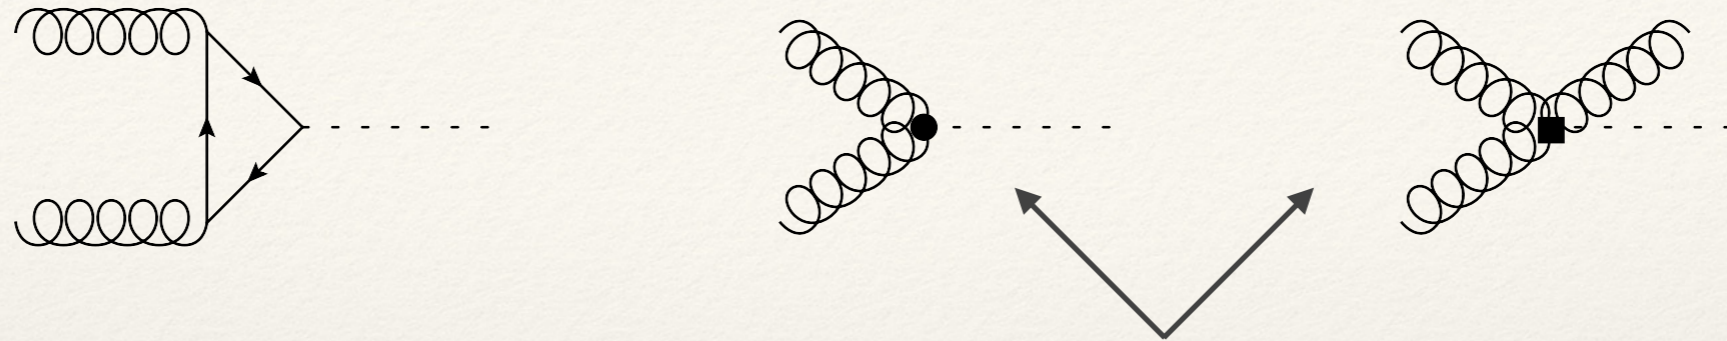

✦ Up to colour factors the same:

▸ eikonal (dipole) factor times shifted Born cross section

▸ Born can be loop-induced, have complex parts etc.

✦ Combine carefully with phase space for general inclusive formula

$$\frac{d\hat{\sigma}_{\mathrm{NLP}}^{(gg)}}{dz} = C_A \, K_{\mathrm{NLP}}\left(z, \epsilon\right) \hat{\sigma}_{\mathrm{Born}}^{(gg)}\left(zs\right) \qquad K_{\mathrm{NLP}}\left(z, \epsilon\right) = \frac{\alpha_s}{\pi}\left(\frac{4\pi\mu^2}{s}\right)^{\epsilon} z\left(1-z\right)^{-1-2\epsilon}\frac{\Gamma^2(-\epsilon)}{\Gamma(-2\epsilon)\Gamma(1-\epsilon)}$$

Single Higgs production

Infinite top mass limit not needed
extra operators = shift in kinematics

✦ **Single Higgs production**

$$\frac{d\sigma^h_{\text{NLP}}}{dz} = \frac{\alpha_s^3 C_A}{288\pi^2 v^2} F(z\tau, \epsilon) \left(\frac{2 - \mathcal{D}_0(z)}{\epsilon} + 2\mathcal{D}_1(z) - \mathcal{D}_0(z) - 4\log(1-z) + 2 \right)$$

▸ with F the well-known Born function. D's and L's agree with exact calculation, but also with full top mass dependence!

Dawson; Spira, Djouadi,
Graudenz, Zerwas

Di-Higgs production

Borowka, Greiner, Heinrich, Jones, Kerner, Schlenk, Zirke

✦ **Double Higgs production at NLO-NLP**

$$z\,\frac{d\sigma^{hh}_{\text{NLP}}}{dz} \;=\; \frac{\alpha_s}{3\pi}\,C_A\,\left(\frac{\overline{\mu}^2}{s}\right)^{\epsilon}\left[\frac{12 - 6\mathcal{D}_0(z)}{\epsilon} + 12\mathcal{D}_1(z) - 24\log(1-z)\right]\sigma^{hh}_{\text{Born}}\left(zs\right)$$

‣ **where**

$$\frac{d\hat{\sigma}^{hh}_{\text{Born}}}{dt} \;=\; \frac{\alpha_s^2}{8\pi^3}\,\frac{1}{512\,v^4}\left[\left|C_\triangle F_\triangle + C_\square F_\square\right|^2 + \left|C_\square G_\square\right|^2\right]$$

✓ with triangle and box graphs, again for full top mass dependence

‣ Should be useful for numerical evaluations, and seeing new patterns
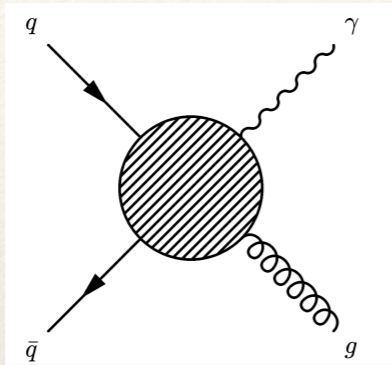

✦ Similar result for triple-Higgs production

De Florian, Mazzitelli

Final state partons:
Prompt photon production

Beenakker, van Beekveld, EL, White
to appear

With FS partons: prompt photon

✦ Two LO channels: q$\bar{q}$ and qg
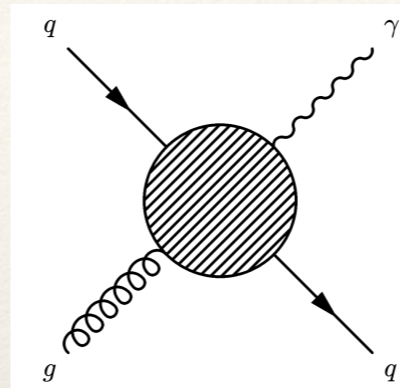

✦ With extra radiation, different ways to define threshold. We shall use "w"→1

$$
\begin{aligned}
u_1 &= (p_1 - p_\gamma)^2 \equiv -svw \\
t_1 &= (p_2 - p_\gamma)^2 \equiv s(v-1) \\
s_4 &= s + t_1 + u_1 = sv(1-w)
\end{aligned}
$$

✦ Two issues to deal with

  ‣ shifting kinematics in 2 → 2 kinematics

  ‣ soft fermion emission

Gluon emission

- ✦ For q$\bar{q}$ channel

- ✦ Can in fact write down general formula

$$
\begin{aligned}
\mathcal{A}_{\mathrm{NLP}} &= \mathcal{A}_{\mathrm{scal}} + \mathcal{A}_{\mathrm{spin}} + \mathcal{A}_{\mathrm{orb}} \\
&= \sum_{j=1}^{n+2} \frac{g_s \mathbf{T}_j}{2 p_j \cdot k} \left(\mathcal{O}^{\sigma}_{\mathrm{scal},j} + \mathcal{O}^{\sigma}_{\mathrm{spin},j} + \mathcal{O}^{\sigma}_{\mathrm{orb},j} \right) \otimes i\mathcal{M}_{\mathrm{H}}(p_1, \ldots, p_i, \ldots, p_{n+2}) \epsilon^*_{\sigma}(k),
\end{aligned}
$$

- ▸ color charge and spin generator depends on emitting IS or FS particle

- ▸ orbitral part on IS or FS particle

Squared amplitude at NLP

✦ Result: again dipoles plus momentum shift

✦ Important to implement $2 \rightarrow 3$ momentum conservation in $2 \rightarrow 2$ matrix element

   ▸ used Catani-Seymour dipoles (FKS is also possible)

Gervais

$$
\begin{aligned}
|\mathcal{A}_{\mathrm{NLP}, q\bar{q} \rightarrow \gamma gg}|^2 \;=\; & \frac{C_F}{C_A} \Bigg[C_F \frac{2 p_1 \cdot p_2}{(p_1 \cdot k)(p_2 \cdot k)} \, |\mathcal{M}_{q\bar{q} \rightarrow \gamma g}(p_1 + \delta p_{1;2}, p_2 + \delta p_{2;1})|^2 \\
& + \frac{1}{2} C_A \frac{2 p_1 \cdot p_R}{(p_1 \cdot k)(p_R \cdot k)} \, |\mathcal{M}_{q\bar{q} \rightarrow \gamma g}(p_1 + \delta p_{1;R}, p_R - \delta p_{R;1})|^2 \\
& + \frac{1}{2} C_A \frac{2 p_2 \cdot p_R}{(p_2 \cdot k)(p_R \cdot k)} \, |\mathcal{M}_{q\bar{q} \rightarrow \gamma g}(p_2 + \delta p_{2;R}, p_R - \delta p_{R;2})|^2 \\
& - \frac{1}{2} C_A \frac{2 p_1 \cdot p_2}{(p_1 \cdot k)(p_2 \cdot k)} \, |\mathcal{M}_{q\bar{q} \rightarrow \gamma g}(p_1 + \delta p_{1;2}, p_2 + \delta p_{2;1})|^2 \Bigg].
\end{aligned}
$$

Note sign change for final state emitter

✦ Integrate over NLO phase, agrees with NLO calculation including ln(1-w) terms

Gordon, Vogelsang

Soft fermions

- ✦ At NLP (not LP) one can have soft fermion emission

  - ▸ Effective feynman rule for left diagram (note that "u(k)" is of order √k)

$$i\mathcal{M}_{\mathrm{NLP},1,g} = \frac{g_s T^a_{c_m c_j}}{(p_1 - k)^2 + i\varepsilon} \epsilon^\mu(p_1)\bar{u}(k)\gamma_\mu \slashed{p}_1 \mathcal{M}_{c_j}(p_1, p_2, \ldots, p_{n+2})$$

  - ▸ Right diagram

$$i\mathcal{M}_{\mathrm{NLP},1,g} = \frac{g_s T^b_{c_m c_i}}{(p_1 - k)^2 + i\varepsilon} \bar{u}(k)\gamma_\rho u(p_1)\mathcal{M}_{\rho,b}(p_1, p_2, \ldots, p_{n+2}).$$

- ✦ Squaring amplitude and integration over phase space gives agreement with exact NLO

  - ▸ Must keep careful track of singular regions

LL resummation of NLP logarithms

Bahjat-Abbas, Bonocore, EL, Magnea, Sinninghe Damsté, Vernazza, White
to appear

LL resummation of NLP logarithms

✦ We have organized NLP threshold logs at NLO and NNLO for Drell-Yan. Can one resum them?

✦ First resummation conjecture: just change kernel in regular resummation formula

Kraemer, EL, Spira; 1998
EL, Magnea, Stavenga

$$\frac{1+z^2}{1-z} \longrightarrow \frac{2}{1-z}-2$$

▸ reproduced NNLO NLP logs of van Neerven et al

✦ Physical kernel approach for inclusive quantities

Soar, Moch, Vemaseren, Vogt;
Moch, Vogt; Mattizelli, de Florian

▸ using single log behaviour of kernel

✦ Recent LL resummation using SCET

Beneke, Broggio, Garny, Jaskiewicz,
Szafron, LV, Wang, 2018

$$\Delta_{\mathrm{NLP}}^{\mathrm{LL}}(z,\mu) = \exp\left[4S^{\mathrm{LL}}(\mu_h,\mu) - 4S^{\mathrm{LL}}(\mu_s,\mu)\right] \times \frac{-8C_F}{\beta_0} \ln\frac{\alpha_s(\mu)}{\alpha_s(\mu_s)}\,\theta(1-z)\,.$$
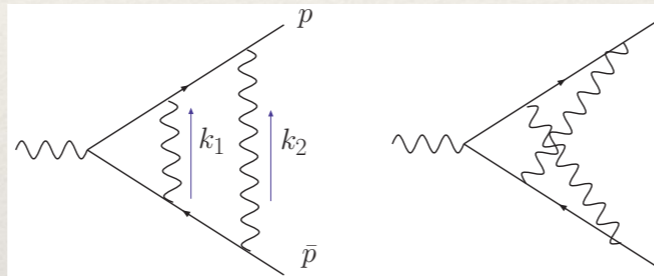

Eikonal exponentiation

✦ After eikonal approximation, we suddenly see interesting patterns.

One loop vertex correction, in eikonal approximation

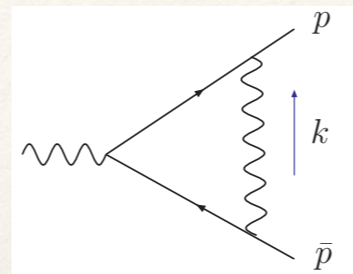

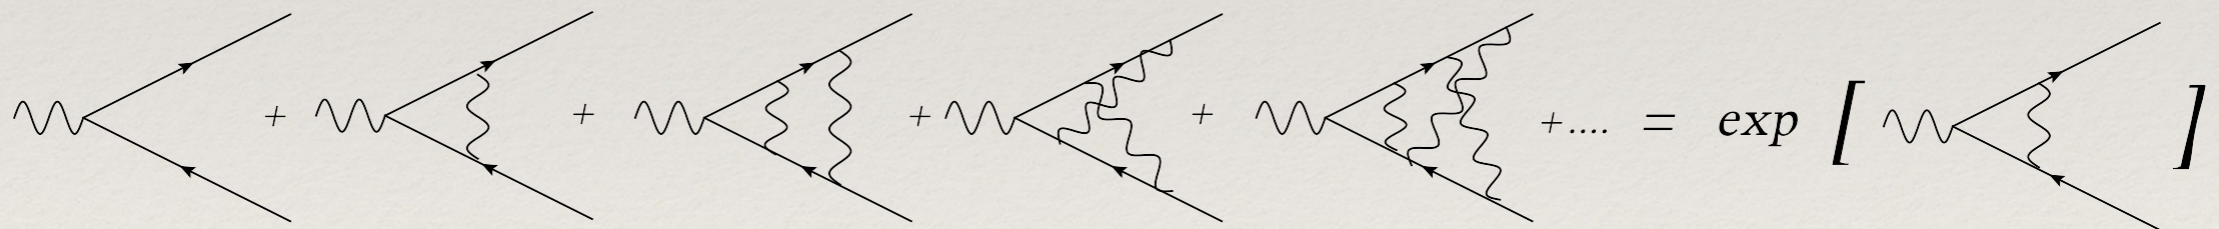

$$\mathcal{A}_0 \int d^n k \frac{1}{k^2} \frac{p \cdot \bar{p}}{(p \cdot k)(\bar{p} \cdot k)}$$

Two loop vertex correction, in eikonal approximation

$$\mathcal{A}_0 \frac{1}{2} \left(\int d^n k \frac{1}{k^2} \frac{p \cdot \bar{p}}{(p \cdot k)(\bar{p} \cdot k)} \right)^2$$
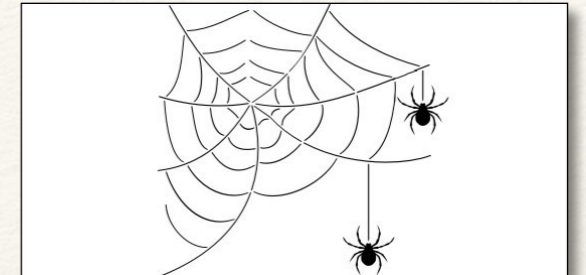

Exponential series

Yennie, Frautschi, Suura '61

31

QCD exponentiation: webs

✦ Not immediately generalizable to QCD, seemingly

  ▸ Vertices terms have color charges, which don't commute

  ▸ Still, an exponentiation theorem holds

$$\sum_D \mathcal{F}_D C_D = \exp\left[\sum_i \bar{C}_i w_i\right]$$

Webs

✦

$$\mathrm{Exp}\left[\; C_F \;+\; \left(-\tfrac{1}{2}C_A C_F\right)\; +\; \left(-\tfrac{1}{2}C_A C_F\right)\; +\dots\;\right]$$

EL, Stavenga, White

# Eikonal approximation from QM path integrals

EL, Stavenga, White

Use textbook result

$$\text{Sum of all diagrams} = \exp\Big(\text{Connected diagrams}\Big)$$

Write scattering amplitude as first-quantized path integral

$$M(p_1, p_2, \{k\}) = \int \mathcal{D}A_s \, \mathcal{D}x(t) \, H[x] \, f_1[A_s, x(t)] \, f_2[A_s, x(t)] \, e^{iS[A_s]}$$

Eikonal vertices are sources for gauge bosons along line

Disconnected   Connected

Can be generalized to non-abelian case (using replica trick)
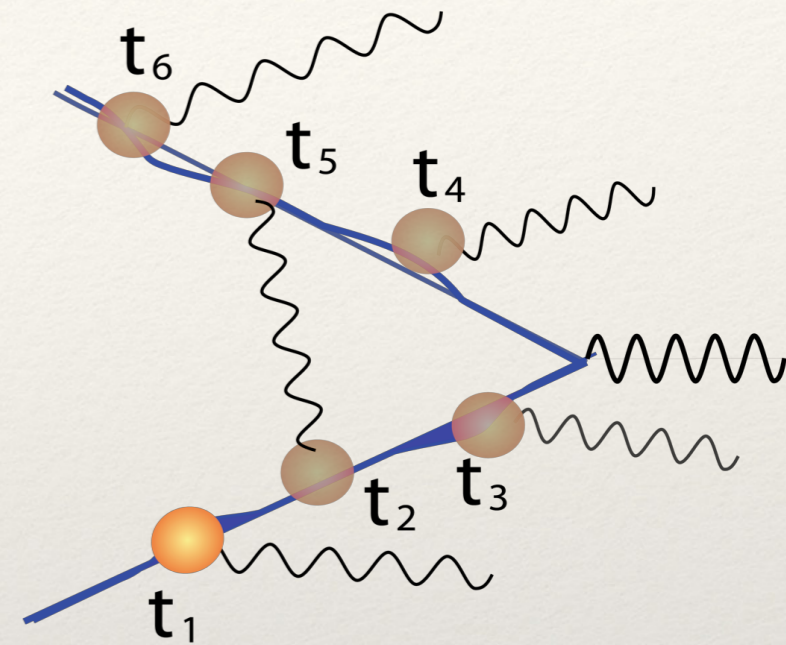

NLP amplitude exponentiation via path integral

EL, Magnea, Stavenga, White

✦ **Fluctuations around classical path are NE corrections**

▸ All NLP corrections from external lines exponentiate

▸ Keep track via scaling variable λ

$$p^\mu = \lambda n^\mu$$

$$f(\infty) = \int_{x(0)=0} \mathcal{D}x \, \exp\left[i \int_0^\infty dt \left(\frac{\lambda}{2}\dot{x}^2 + (n+\dot{x})\cdot A(x_i + nt + x)\right.\right.$$
$$\left.\left. + \frac{i}{2\lambda}\partial \cdot A(x_i + p_f t + x)\right)\right]$$

✦ **Exponentiation then in terms of NLP webs**

$$\sum C(D)\mathcal{F}(D) = \exp\left[\bar{C}(D)W_{\mathrm{E}}(D) + \bar{C}'(D)W_{\mathrm{NE}}(D)\right]$$

Bonocore, EL, Magnea, Melville, Vernazza, White

LL resummation for cross section at NLP

- ✦ Can show that phase space NLP effects behave as

$$\varepsilon\left(1-z\right)$$

  - ▸ i.e. softness suppression comes with singularity suppression

- ✦ Can show that there are no LL enhancements from purely collinear regions (single log)

- ✦ LL effects come then only from NLP soft function

Exponentiating NLP soft function

✦ Moments of cross section

$$\int_0^1 d\tau\, \tau^{N-1} \frac{d\sigma_{\text{DY}}}{d\tau}\bigg|_{\text{LL, NLP}} = \sigma_0(Q^2)\, q_N(Q^2)\bar{q}_N(Q^2)\, \bar{\mathcal{S}}_{\text{NLP}}(N, Q^2, \epsilon),$$

✦ with NLP soft function (f's are NLP Wilson lines)

$$\tilde{\mathcal{S}} = \frac{1}{N_c} \sum_n \text{Tr}\left[\langle 0|f_2^\dagger f_1|n\rangle\langle n|f_1^\dagger f_2|0\rangle\right] \delta\left(z - \frac{Q^2}{\hat{s}}\right).$$

✦ Exponentiation then gives

$$\int_0^1 d\tau\, \tau^{N-1} \frac{d\sigma_{\text{DY}}}{d\tau}\bigg|_{\text{LL, NLP}} = \sigma_0(Q^2)\, q_{\text{LL, NLP}}(N, Q^2)\, \bar{q}_{\text{LL, NLP}}(N, Q^2)$$

$$\times \exp\left[\frac{\alpha_s C_F}{\pi}\left(2\log^2(N) + \frac{4\log(N)}{N}\right)\right].$$

▸   agrees with old conjecture

Summary

* NLP factorization (LBDK theorem) leads to strong prediction for NLP threshold logs

  ‣ Drell-Yan at NNLO

* Explicit formulae at NLO for any colour singlet final state, and now also coloured final state

* LL resummation at NLP for Drell-Yan done

  ‣ NLL seems much harder..
