

## MT 26 International Conference on Magnet Technology Vancouver, Canada | 2019

Contribution ID: 1213

Type: Poster Presentation

## Tue-Mo-Po2.07-03 [43]: Charging, Discharging, and Over-current Characteristics of Partially Insulated MgB2 Magnet Using Cr-coated MgB2 Wires

Tuesday 24 September 2019 08:45 (2 hours)

Recently, we developed a 0.5-T/300 mm MgB2 magnet using the partial insulation (PI) winding technique that only employs layer-to-layer insulations without the turn-to-turn insulations; the magnet was self-protective but has a significant charge—discharge delay. In this study, the use of Cr-coated MgB2 wires was proposed as an alternative solution to enhance the characteristic resistance of the MgB2 magnet, in combination with the PI winding technique. The charging—discharging tests confirmed that the charging—discharging rates of the PI magnet that uses Cr-coated wires was ten times faster than the magnet that utilizes uncoated wires. In addition, the self-protective behavior of the PI magnet that uses the Cr-coated wires were verified via the overcurrent tests. Herein, the feasibility of employing the proposed winding technique for the development of self-protective MgB2 magnetic resonance imaging magnets with fast charging—discharging rates was discussed in detail.
