

Details of a Staggered Fermion Data Analysis

Maximilian Ammer

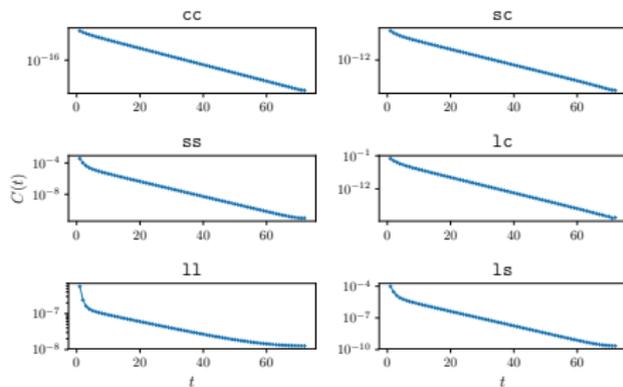

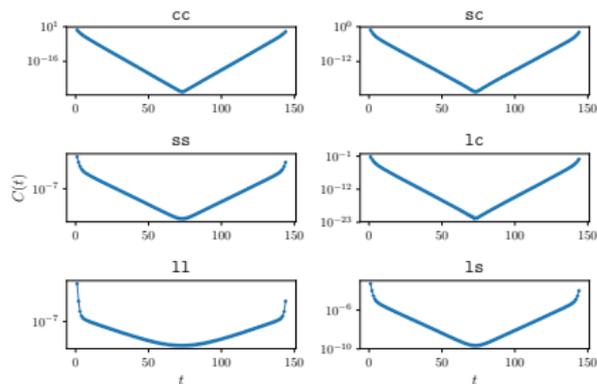

**BERGISCHE
UNIVERSITÄT
WUPPERTAL**

- Data generated by BMWG, analysis in collaboration with Stephan Dürr
- Staggered Fermion simulation with $N_f = 2 + 1 + 1$
- Analysis of one ensemble with $\beta = 4.0126$ ($a \approx 0.063$ fm) close to the physical point
- Analysis of the six pseudo-scalar channels (11, ss, cc, ls, lc, sc)
- Extraction of effective masses and effective decay constants in lattice units

- Correlator data ($N \times T = 441 \times 144$ matrices)
- Symmetrize to reduce noise (discarding value at $t = 0$)

$$\rightarrow C(t) = \frac{1}{N} \sum_{i=1}^N C_i(t), \quad t \in \{1, 2, \dots, T/2 = 72\}$$

Blocking

To calculate statistical errors and covariances:

- Block data to minimize auto-correlation between configurations:

$$N = n_{(\text{bins})} \cdot l_{\text{bin}} + n_{\text{disc}}$$

- Average each block:

$$C_i^{\text{bl}}(t) = \frac{1}{l_{\text{bin}}} \sum_{j=(i-1) \cdot l_{\text{bin}}+1}^{i \cdot l_{\text{bin}}} C_j(t)$$

- Jackknife resampling:

$$C_i^{\text{jk}}(t) = \frac{1}{n-1} \sum_{j \neq i}^n C_j^{\text{bl}}(t)$$

- Jackknife errors:

$$\tilde{\sigma}_C(t)^2 = (n-1) \cdot \langle (C_i^{\text{jk}}(t) - \langle C_i^{\text{jk}}(t) \rangle_n)^2 \rangle_n$$

- Compensate for discarded configurations:

$$\sigma_C(t) = \sqrt{\frac{N-n_{\text{disc}}}{N}} \cdot \tilde{\sigma}_C(t).$$

- Choose block size:

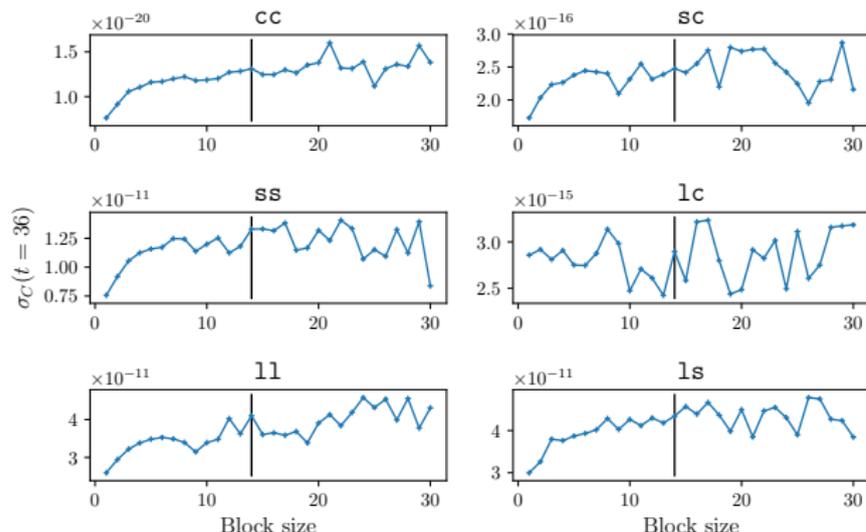

Figure: Jackknife errors of $C(t = 36)$ for different block sizes.

- Here $l_{\text{bin}} = 14$ was chosen
→ errors close to errors from Γ -method (UWerr).

Assuming a single decaying exponential for the correlator:

$$C(t) = Fe^{-Mt}$$

- Local effective mass in terms of discretized derivative:

$$M_{\text{eff}}^{(\text{ld})}(t) := \frac{\ln C(t-a) - \ln C(t)}{a} \quad (\text{left derivative})$$

$$M_{\text{eff}}^{(\text{rd})}(t) := \frac{\ln C(t) - \ln C(t+a)}{a} \quad (\text{right derivative})$$

$$M_{\text{eff}}^{(\text{cd})}(t) := \frac{\ln C(t-a) - \ln C(t+a)}{2a} \quad (\text{central derivative}).$$

- Local effective decay constant:

$$F_{\text{eff}}^{(\text{cd})}(t) := \frac{C(t)}{e^{-M_{\text{eff}}^{(\text{cd})}(t) \cdot t}}.$$

Including backwards running contribution from periodic boundary conditions:

$$C(t) = F \left(e^{-Mt} + e^{-M(T-t)} \right) = 2Fe^{-M\frac{T}{2}} \cosh \left(M \left(\frac{T}{2} - t \right) \right)$$

- Local effective mass according to *Beane et al*¹ :

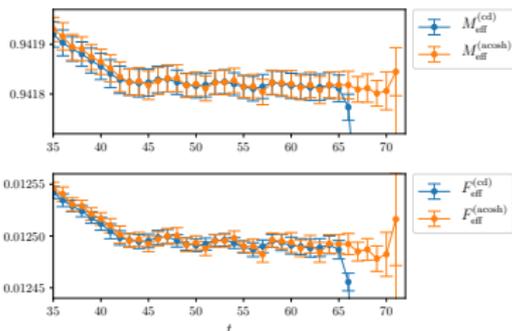

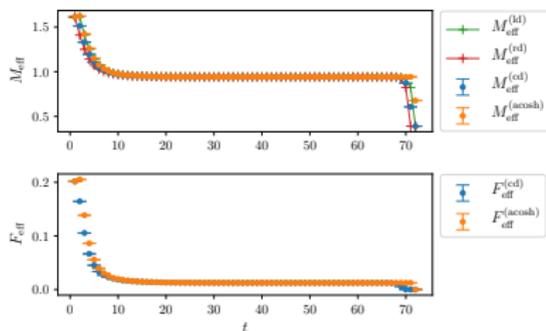

$$M_{\text{eff}}^{(\text{acosh})}(t) := \frac{1}{a} \cosh^{-1} \left(\frac{C(t-a) + C(t+a)}{2C(t)} \right).$$

- Then the effective decay constant is given by:

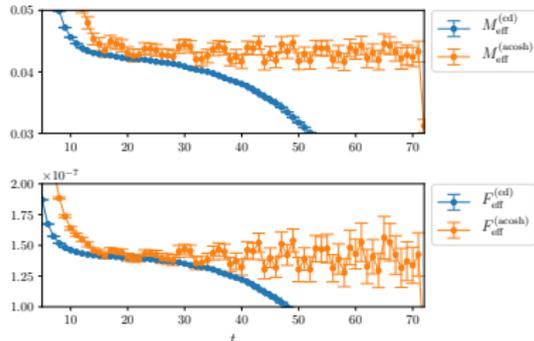

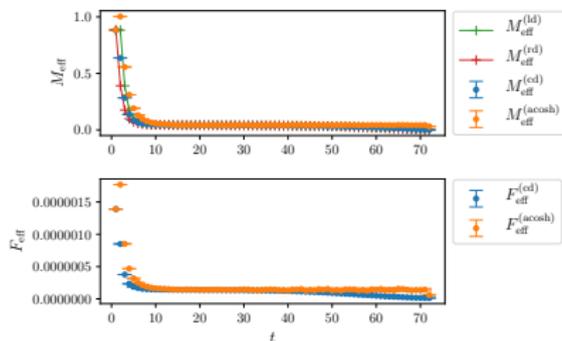

$$F_{\text{eff}}^{(\text{acosh})}(t) := \frac{C(t)}{e^{-M_{\text{eff}}^{(\text{acosh})}(t) \cdot t} + e^{-M_{\text{eff}}^{(\text{acosh})}(t) \cdot (T-t)}}.$$

- sc-channel: (\rightarrow use $M_{\text{eff}}^{(\text{cd})}$)

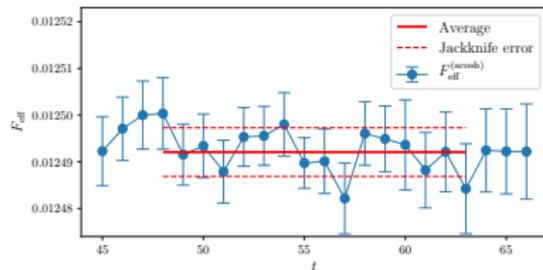

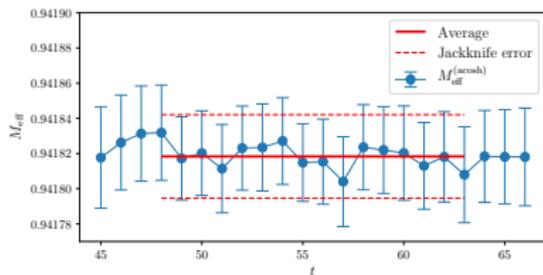

- ls-channel: (\rightarrow use $M_{\text{eff}}^{(\text{acosh})}$)

Fit functions for $M_{\text{eff}}(t)$ and $F_{\text{eff}}(t)$

- First **average** inside mass plateau:

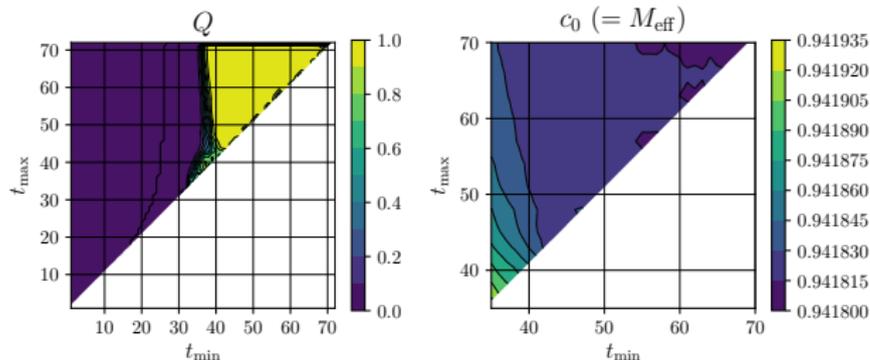

Fit functions for $M_{\text{eff}}(t)$ and $F_{\text{eff}}(t)$

- First average inside mass plateau:
- Fitting a constant:
 - Fit function: $f(t) = c_0$

Fit functions for $M_{\text{eff}}(t)$ and $F_{\text{eff}}(t)$

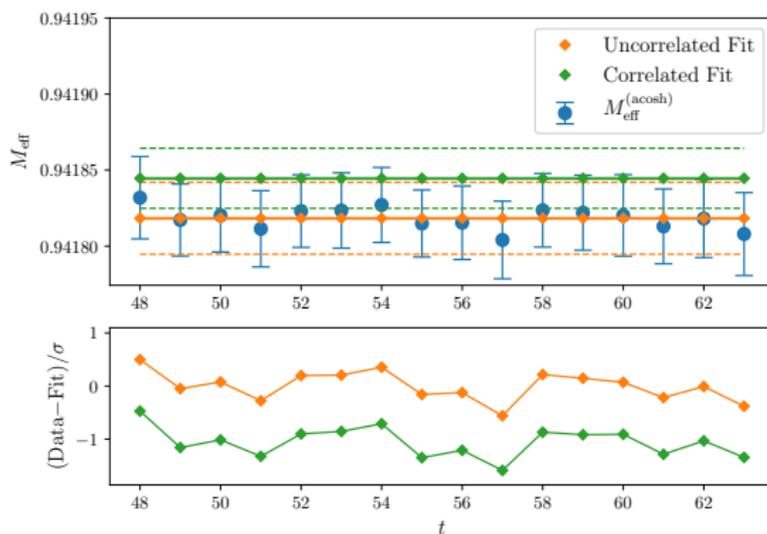

- First average inside mass plateau:
- Fitting a constant:
 - Fit function: $f(t) = c_0$
 - Determine suitable fit window $\rightarrow [t_{\min}, t_{\max}] = [48, 63]$

$$Q = \frac{\Gamma\left(\frac{m}{2}, \frac{\chi^2}{2}\right)}{\Gamma\left(\frac{m}{2}\right)} = \frac{\int_{\frac{\chi^2}{2}}^{\infty} \tau^{\frac{m}{2}-1} e^{-\tau} d\tau}{\int_0^{\infty} \tau^{\frac{m}{2}-1} e^{-\tau} d\tau}, \quad m = (t_{\max} - t_{\min} + 1) - n_{\text{par}}.$$

Fit functions for $M_{\text{eff}}(t)$ and $F_{\text{eff}}(t)$

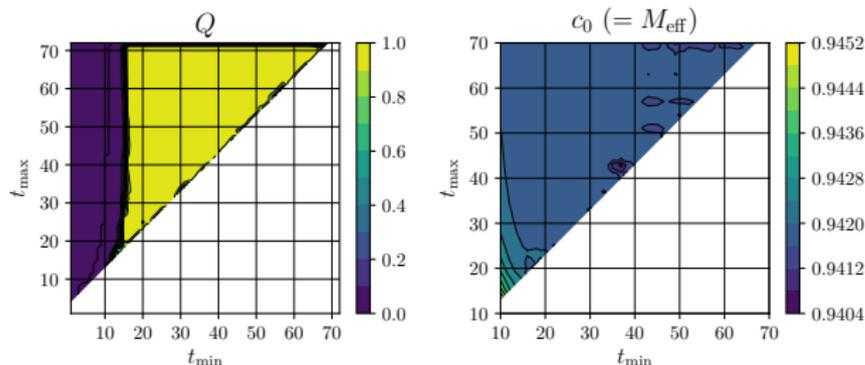

- First average inside mass plateau:
- Fitting a constant:
 - Fit function: $f(t) = c_0$
 - Determine suitable fit window $\rightarrow [t_{\text{min}}, t_{\text{max}}] = [48, 63]$
 - **Uncorrelated fit**
 - **Correlated fit**

- First average inside mass plateau:
- Fitting a constant:
 - Fit function: $f(t) = c_0$
 - Determine suitable fit window $\rightarrow [t_{\min}, t_{\max}] = [48, 63]$
 - Uncorrelated fit
 - Correlated fit
 - Perform **fits on all n Jackknife samples** and calculate error of fit parameters:

$$\sigma_{c_0}^2 = \frac{n-1}{n} \sum_i^n (c_0^i - c_0)^2 \cdot \frac{N-n_{\text{disc}}}{N}$$

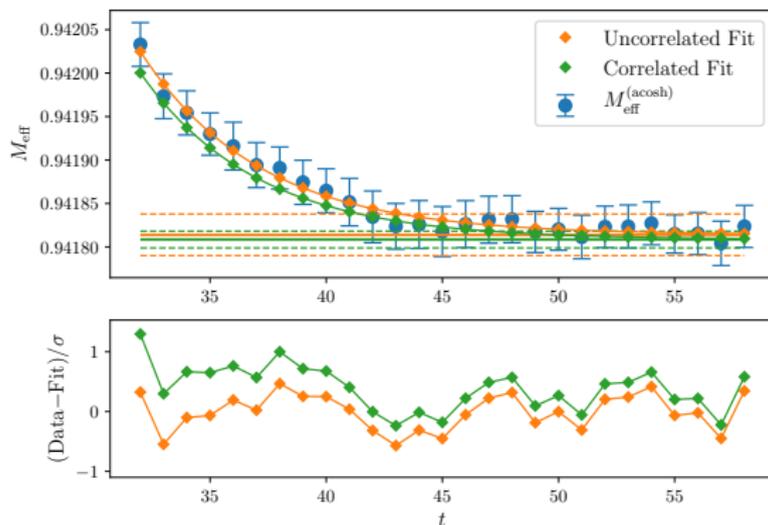

- Fitting a constant plus an exponential:
 - Fit function: $f(t) = c_0 + c_1 e^{-c_2 t}$
 - Determine suitable fit window $\rightarrow [t_{\min}, t_{\max}] = [32, 58]$

- Uncorrelated fit
- Correlated fit

Fit functions for $M_{\text{eff}}(t)$ and $F_{\text{eff}}(t)$

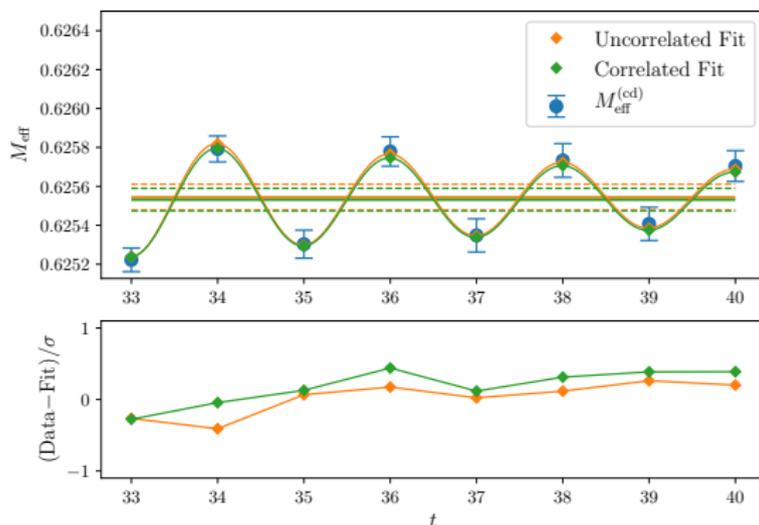

- Fitting a constant plus an exponential:
 - **Fit function:** $f(t) = c_0 + c_1 e^{-c_2 t}$
 - Determine suitable fit window $\rightarrow [t_{\min}, t_{\max}] = [32, 58]$
 - Uncorrelated fit
 - Correlated fit

Fit functions for $M_{\text{eff}}(t)$ and $F_{\text{eff}}(t)$

For **sc,lc,ls**-channels fit staggered oscillations with extra **cos**-terms:

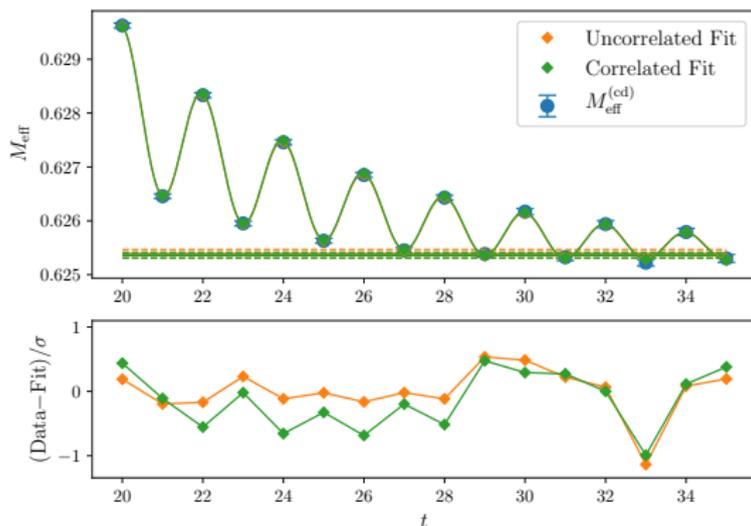

- Fit function $f(t) = c_0 + c_1 e^{-c_2 t} \cos(\pi t)$:

Fit functions for $M_{\text{eff}}(t)$ and $F_{\text{eff}}(t)$

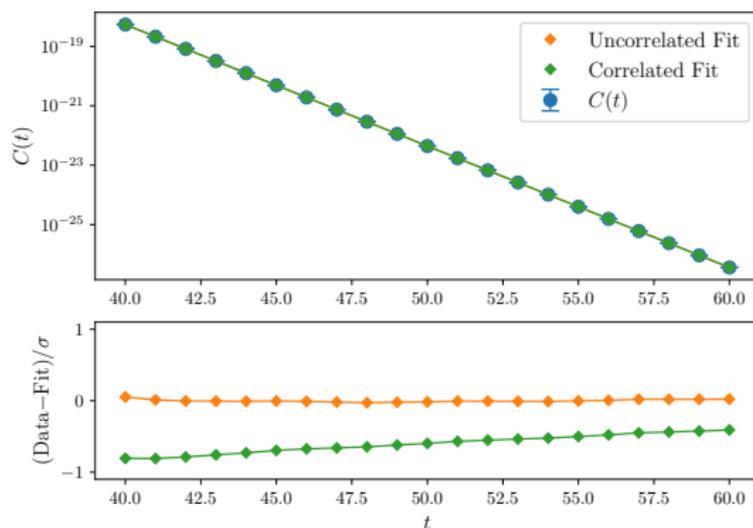

For **sc,lc,ls**-channels fit staggered oscillations with extra **cos**-terms:

- Fit function $f(t) = c_0 + c_1 e^{-c_2 t} \cos(\pi t)$:
- Fit function $f(t) = c_0 + c_1 e^{-c_2 t} + c_3 e^{-c_4 t} \cos(\pi t)$:

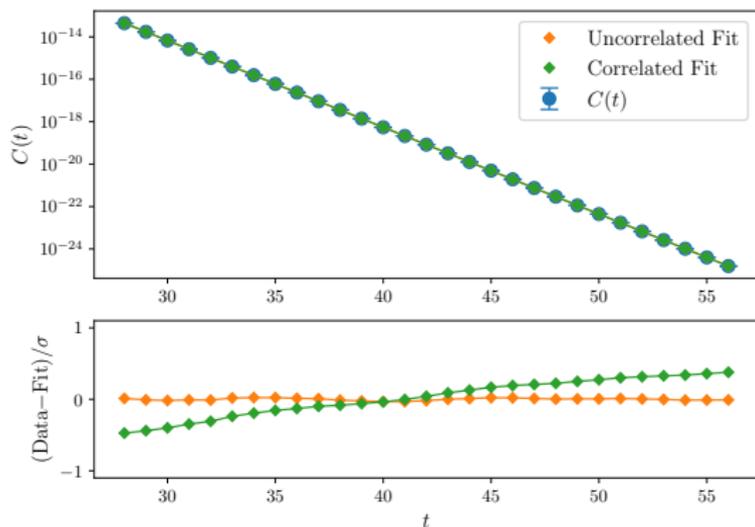

Fitting the Correlator

- `cc,ss,ll`-channel: fit one, two or more `cosh`-functions.
- Fit function $f(t) = c_0 (e^{-\alpha t} + e^{\alpha(t-T)})$

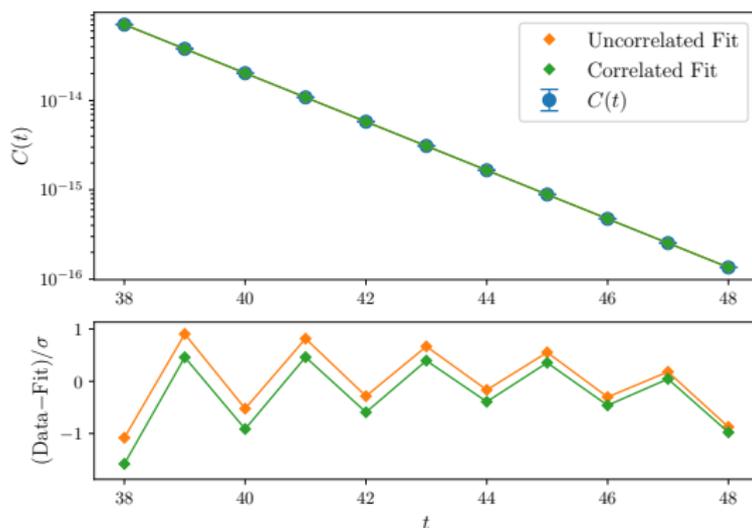

Fitting the Correlator

- **cc,ss,ll**-channel: fit one, two or more **cosh**-functions.
- Fit function $f(t) = c_0 (e^{-c_1 t} + e^{c_1(t-T)}) + c_2 (e^{-c_3 t} + e^{c_3(t-T)})$
- Impose $c_1 < c_3$

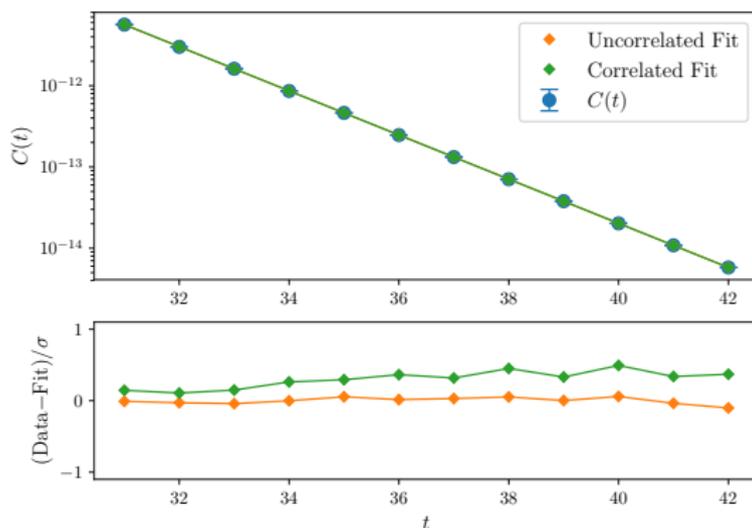

Fitting the Correlator

- **sc,lc,ls**-channel: fit one, two or more **cosh**-functions
- Fit function $f(t) = c_0 (e^{-\alpha t} + e^{\alpha(t-T)})$

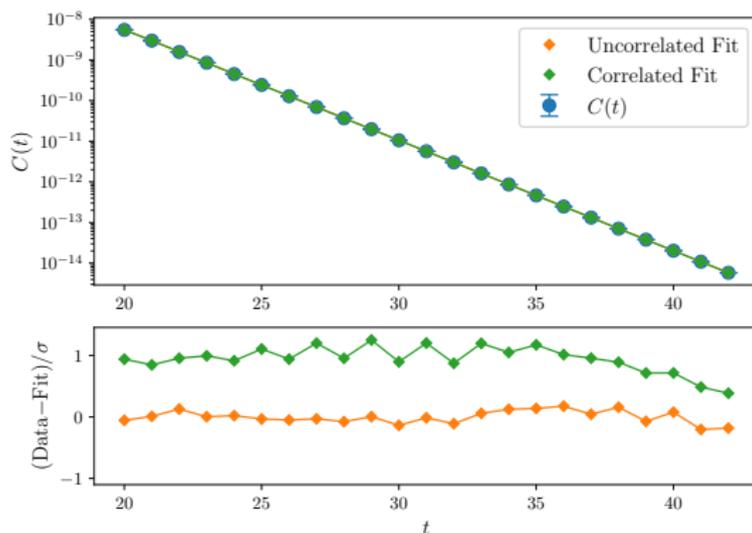

Fitting the Correlator

- **sc,lc,ls**-channel: fit one, two or more **cosh**-functions plus **cos**-term.
- Fit function $f(t) = c_0 (e^{-c_1 t} + e^{c_1(t-T)}) + c_2 e^{-c_3 t} \cos(\pi t)$

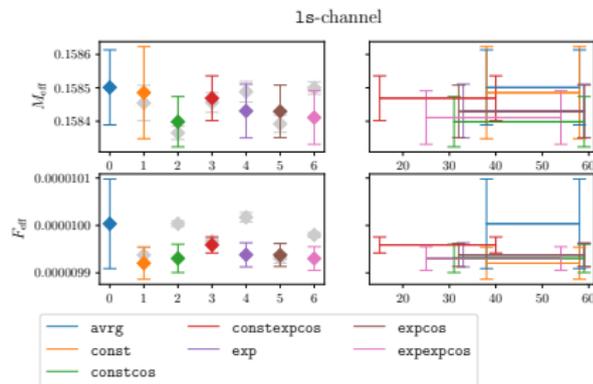

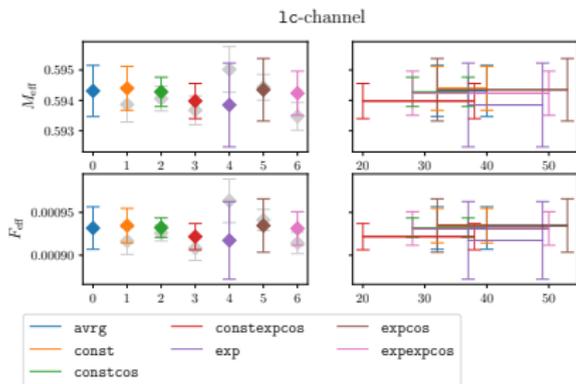

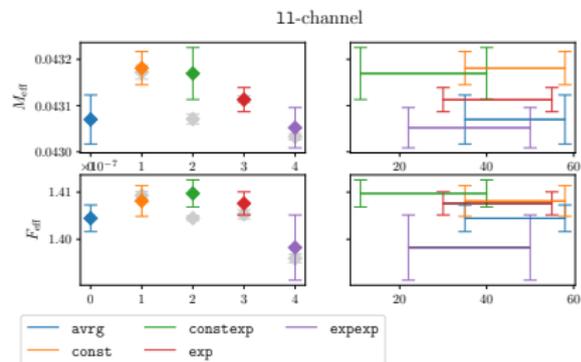

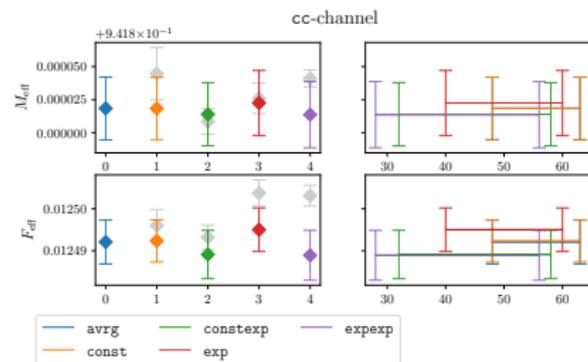

Fitting the Correlator

- **sc,lc,ls**-channel: fit one, two or more **cosh**-functions plus **cos**-term.
- Fit function
$$f(t) = c_0 (e^{-c_1 t} + e^{c_1(t-T)}) + c_2 (e^{-c_3 t} + e^{c_3(t-T)}) + c_4 e^{-c_5 t} \cos(\pi t)$$

Correlated Fitting

Sample Covariance Matrix:

$$\text{Cov}_C(t, t') = (n - 1) \left\langle \left(C_i(t) - \langle C_i(t) \rangle \right) \left(C_i(t') - \langle C_i(t') \rangle \right) \right\rangle \cdot \frac{N - n_{\text{disc}}}{N}$$

$$\text{Cov}_C(t, t) = \sigma_C^2(t)$$

Correlated fitting \Leftrightarrow minimizing χ_{cor}^2

$$\chi_{\text{cor}}^2 = \sum_{t, t' = t_{\min}}^{t_{\max}} (f(t) - C(t)) \text{Cov}_C^{-1}(t, t') (f(t') - C(t'))$$

Uncorrelated fitting \Leftrightarrow minimizing χ_{uncor}^2

$$\chi_{\text{uncor}}^2 = \sum_{t=t_{\min}}^{t_{\max}} \frac{(f(t) - C(t))^2}{\sigma_C^2(t)}$$

Known Issues with correlated fitting (see e.g. *C. Michaels '93*², *Seibert '93*³...):

- Only trustworthy for $p = t_{\max} - t_{\min} \ll n$ (here $p = 10 \sim 30$, $n = 31$).
- Otherwise underestimates errors.
- Singular behaviour for $p > n$.
- Very badly conditioned for $p \approx n$ (here $\text{cond} \approx 10^{12} \sim 10^{30}$).
→ Numerical inversion introduces large biases.

³hep-lat/9305014

Methods to modify/truncate the covariance matrix:

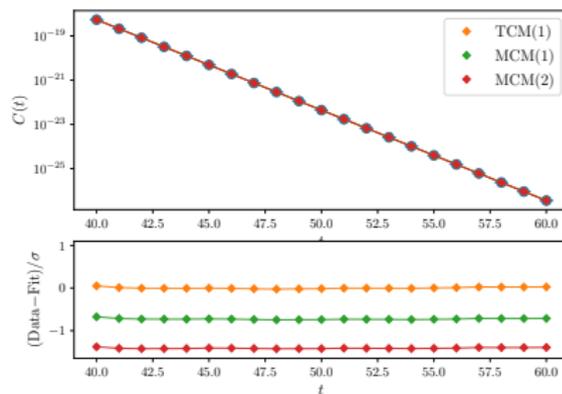

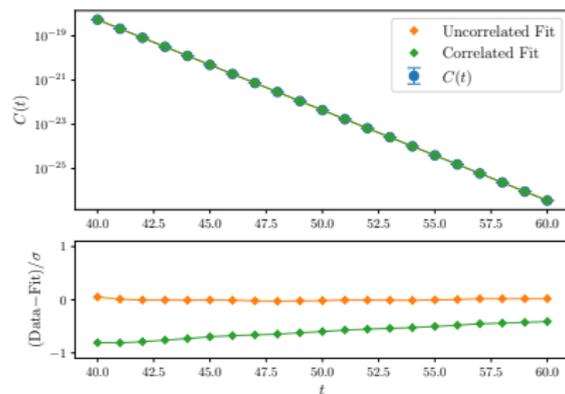

- TCM(i)-Method: Truncate Covariance Matrix, keep only i off-diagonals.
 - Resulting matrix is no longer positive (semi-)definite.
 - Very unreliable for fixed i .
- MCM(i)-Method: Remove all but the i largest singular values of the correlation matrix.
 - For $i = 1$ result is often very close to uncorrelated fit.
 - For $i \leq 2$ result is often close to or worse than correlated fit.
- Many more ...

Examples: (cc-channel, constant fits)

Modified Covariance Matrices

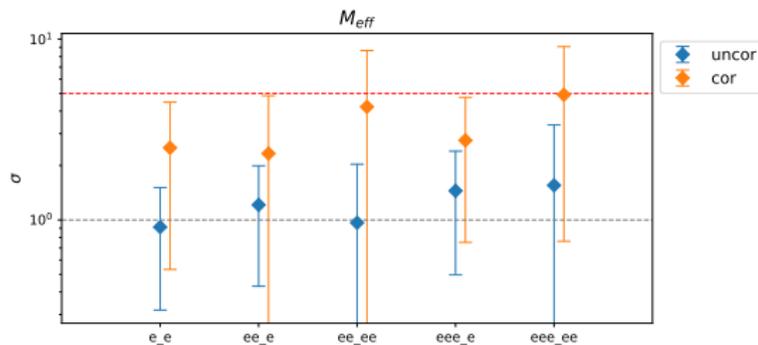

Examples: (cc-channel, one cosh-function fit)

Is correlated fitting necessary?

Test fitting methods on **synthetic** correlator data:

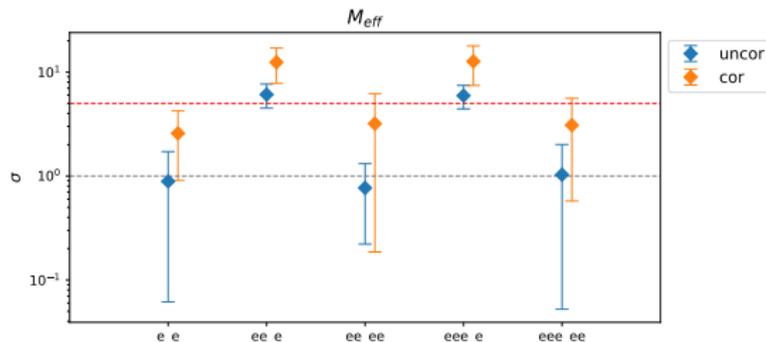

- Data with normally distributed uncorrelated noise:

Is correlated fitting necessary?

Is correlated fitting necessary?

Test fitting methods on **synthetic** correlator data:

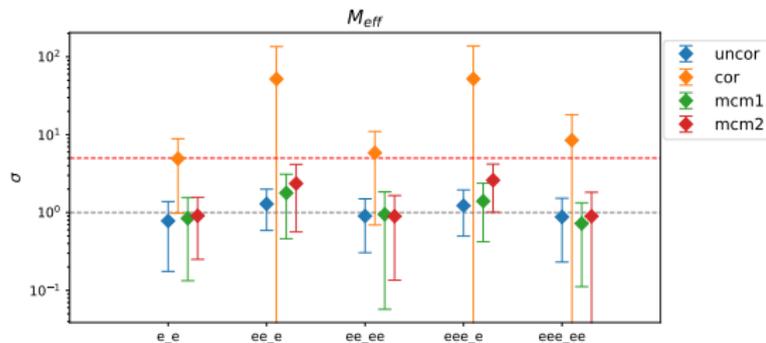

- Data with normally distributed uncorrelated noise:
- Data with correlated noise (adding normally distributed noise to noise from neighboring time-slice):
- Data with correlated noise ("multiplying" normally distributed noise with covariance of real data):

- Uncorrelated fitting appears to produce best results.
- Always include (at least) the first excited state in correlator fits.
- Modification/truncation methods do not improve on uncorrelated fits.

Thank you.
