

# The $\rho$ -resonance from Lattice QCD with $N_f = 2 + 1 + 1$ dynamical quark flavors

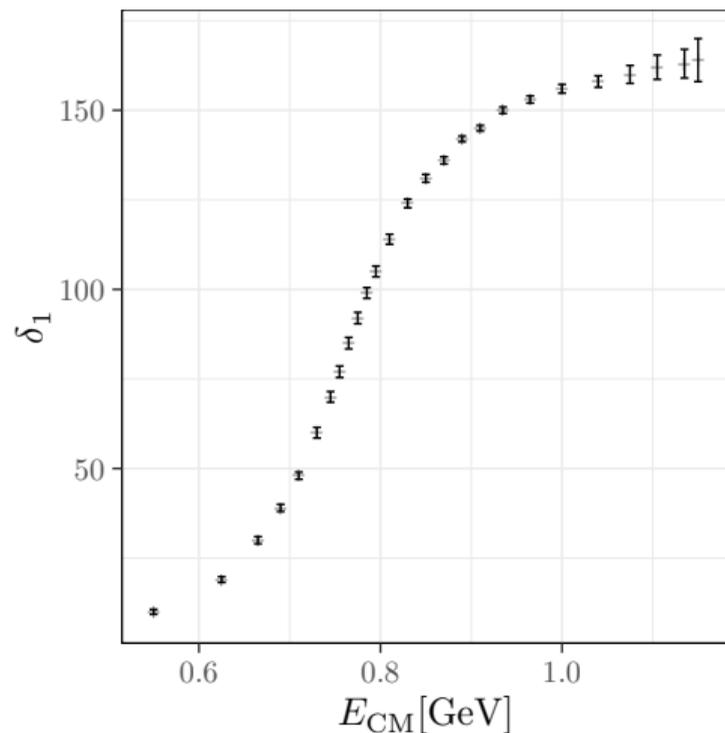

M. Werner   C. Helmes   C. Jost   B. Kostrzewa   C. Liu   L. Liu   B. Metsch  
M. Petschlies   **M. Ueding**   C. Urbach

37th Annual International Symposium on Lattice Field Theory

2019-06-18

## Motivation

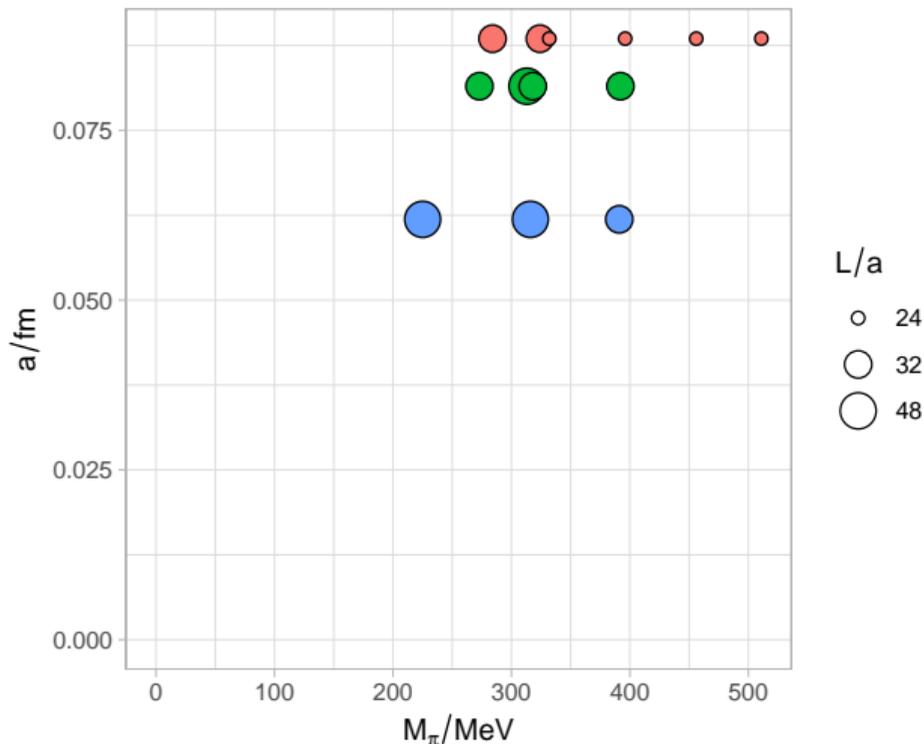

- ▶ Investigate  $\pi\pi$  scattering in  $l = 1, \ell = 1$
- ▶ Experimentally well-known
- ▶ Test-bed for elusive resonances
- ▶ Phase shift from Lüscher method
- ▶ Extensively studied in LQCD:  
Feng et al. 2011, Lang et al. 2011, Dudek et al. 2013, RQCD 2015, Fu & Wang 2016, Guo et al. 2013, Alexandru et al. 2017, Alexandru et al. 2019, Andersen et al. 2019
- ▶ Here: Chiral and continuum extrapolation

[Protopopescu et al. 1973, PRD 7, 1279]

# ETMC ensembles

Baron et al. 2010 [1004.5284]; Baron et al. 2011 [1005.2042]

- ▶ 13 ensembles
- ▶ Different  $M_\pi, L$
- ▶ Three  $\beta$  values
- ▶ Iwasaki gauge
- ▶  $N_f = 2 + 1 + 1$  twisted mass fermions
  - ▶ Automatic  $O(a)$  improvement [Frezzotti & Rossi 2004]
  - ▶ Isospin broken at  $O(a)$   
Potential  $2\pi_0$  pollution, not visible

# Spectrum extraction

## Correlator matrix

- ▶  $\pi(\mathbf{d} - \mathbf{q}) \pi(\mathbf{q})$  with  $i\gamma_5$
- ▶  $\rho(\mathbf{d})$  with  $i\gamma_i$  and  $\gamma_0\gamma_i$

## Using multiple

- ▶ relative integer momenta  $\mathbf{q}$
- ▶ total momenta  $\mathbf{p} = 2\pi\mathbf{d}/L$
- ▶ irreps  $\Gamma$

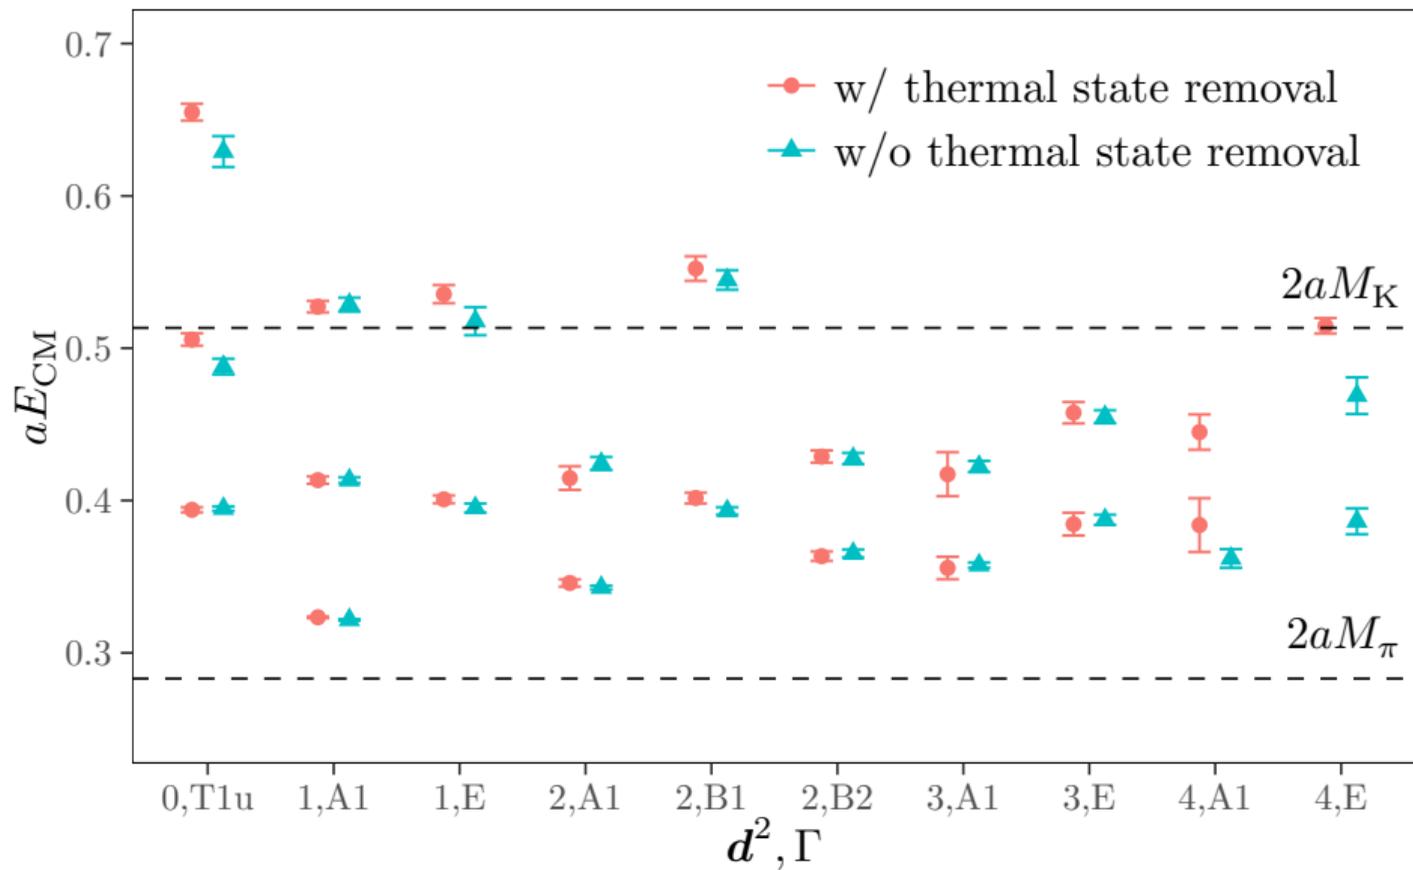

$$\mathbf{d}^2 \leq 4$$

$$\mathbf{q}^2 \leq 4, \text{ depending on } \mathbf{d}^2$$

## Energy extraction

- ▶ Thermal state removal via *weight and shift*  
[Dudek et al. 2012, Phys. Rev. D 86, 034031]
- ▶ Also without, estimates systematic error
- ▶ GEVP with up to  $6 \times 6$
- ▶ Fitting principal correlators with one range by hand

## Spectrum on one ensemble (A40.32)

## Zeta function singularities

Use Lüscher formalism to convert energies  $E_{\text{CM}}$  to phase shifts  $\delta_1$

- ▶ Lüscher's Zeta function has singularities at non-interacting energies
- ▶ Resampling distributions might cross them
- ▶ Crossing is unphysical, prohibits usage of energy level
- ▶ Jackknife distribution narrower than bootstrap distribution
- ▶ Still need to check for singularity crossing

# Breit-Wigner fit to phase shifts

Brown & Goble, PRL 20, 346 (1968)

One fit per ensemble

Phase shift:

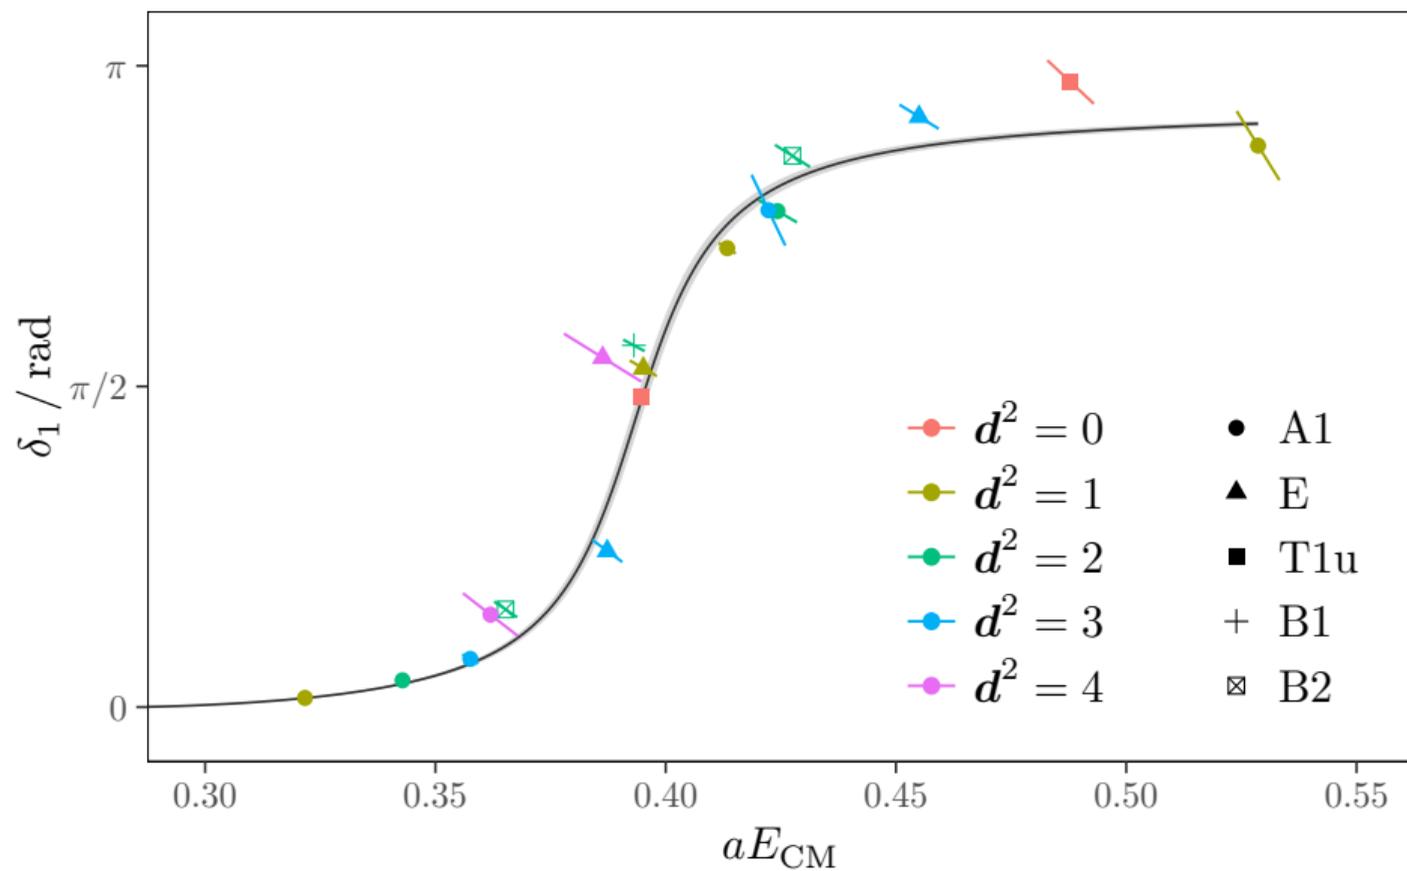

$$\tan \delta_1 = \frac{g_{\rho\pi\pi}^2}{6\pi} \frac{\rho^3(E_{\text{CM}})}{E_{\text{CM}}(M_\rho^2 - E_{\text{CM}}^2)}, \quad \rho(E_{\text{CM}}) = \sqrt{E_{\text{CM}}^2/4 - M_\pi^2}$$

Mass dependent width:

$$\Gamma_\rho = \frac{2}{3} \frac{g_{\rho\pi\pi}^2}{4} \frac{\rho^3(M_\rho)}{M_\rho^2}$$

Fit parameters:  $g_{\rho\pi\pi}$  and  $M_\rho$

## Phase shift on one ensemble

# Chiral extrapolation

Djukanovic et al. 2009 [0902.4347]; Djukanovic et al. 2009 [1001.1772]

Combined fit to  $M_\rho$  and  $\Gamma_\rho$  with  $Z = (M_\rho - i\Gamma_\rho/2)^2$

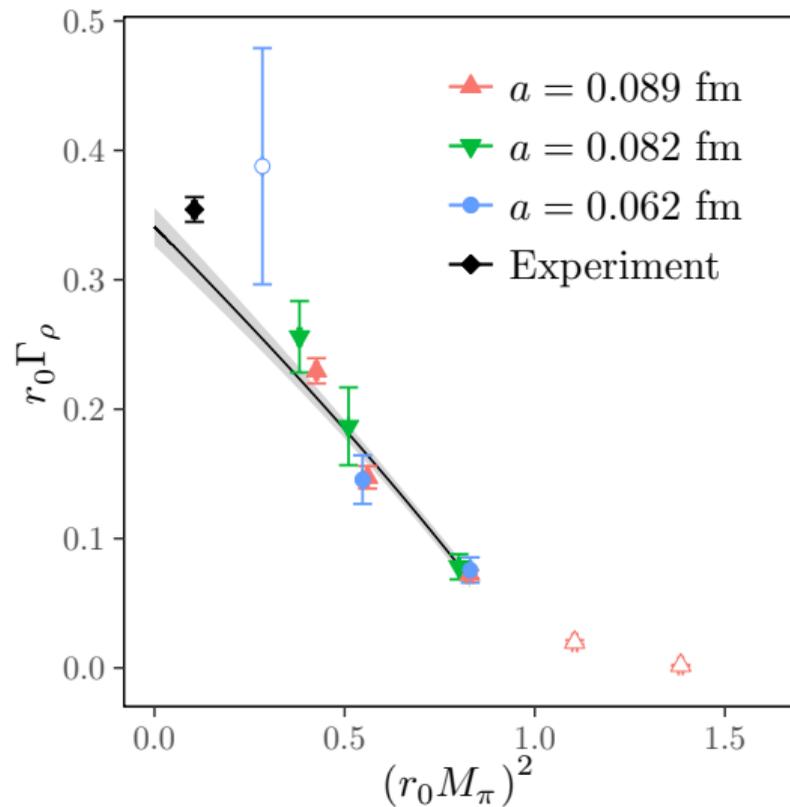

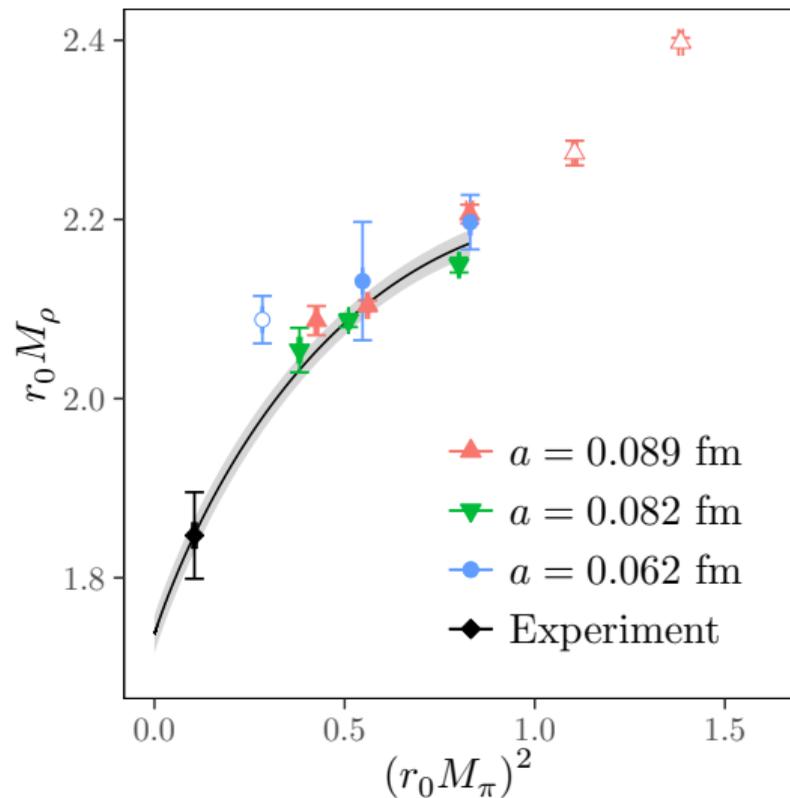

Fit model from EFT with vector meson dominance:

$$a^2 Z = p_{r_0/a}^{-2} \left( (p_1 + ip_2) + p_3 (p_{r_0/a} a M_\pi)^2 - p_4 \sqrt{p_1 + ip_2} (p_{r_0/a} a M_\pi)^3 + (p_5 + ip_6) p_{r_0/a}^{-2} \right)$$

- ▶  $p_1 + ip_2$  is  $\rho$  pole in chiral limit
- ▶  $p_4$  comes from  $\omega\rho\pi$  coupling
- ▶  $p_{r_0/a}$  Sommer parameter, prior not shown
- ▶ Last summand is complex lattice artifact

# Chiral extrapolation

Djukanovic et al. 2009 [0902.4347]; Djukanovic et al. 2009 [1001.1772]

## Results & discussion

- ▶ Our result:

$$M_\rho = 769(19) \text{ MeV}, \quad \Gamma_\rho = 129(7) \text{ MeV}$$

- ▶ Experimental result [PDG 2018]:

$$M_\rho = 775.26(25) \text{ MeV}, \quad \Gamma_\rho = 149.1(8) \text{ MeV}$$

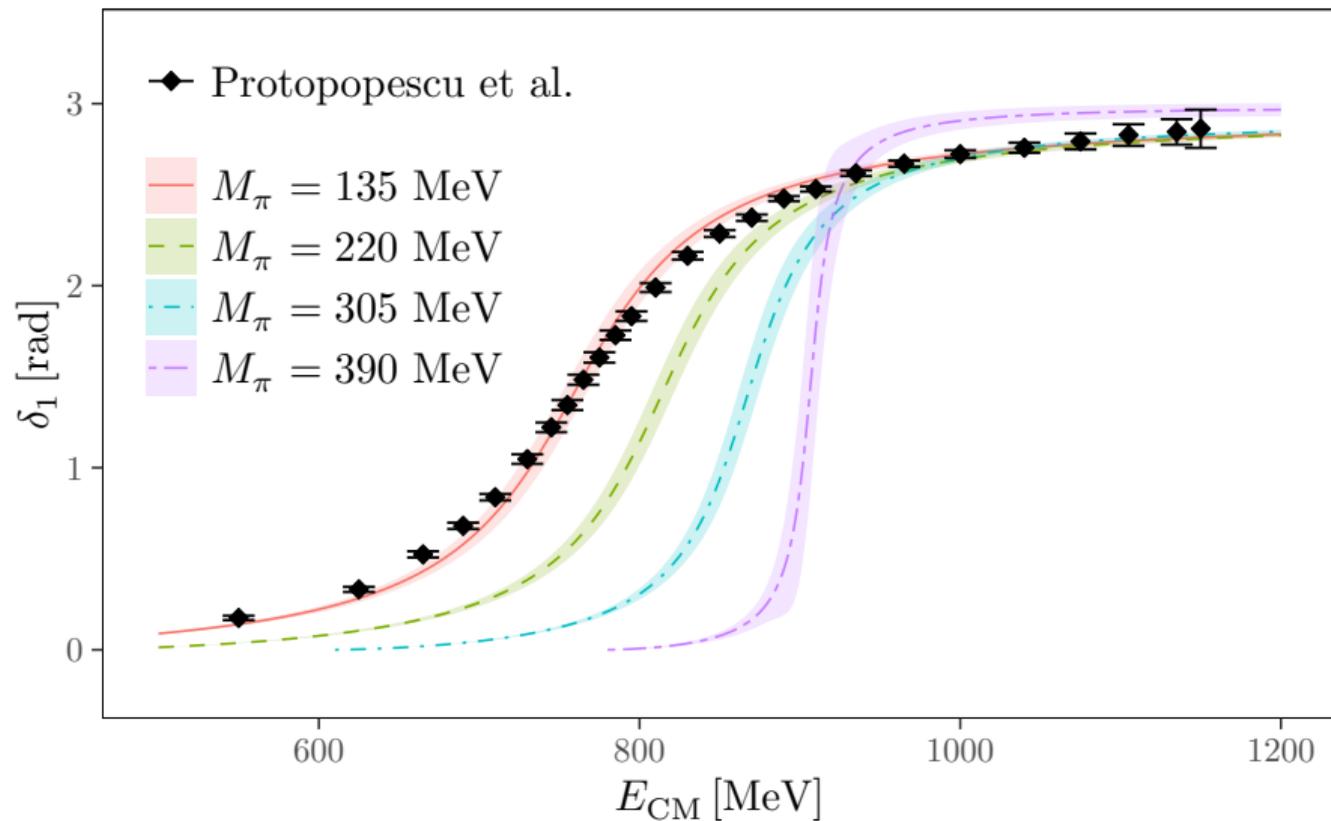

- ▶ Lattice artifact not resolvable

- ▶ Systematic effects:

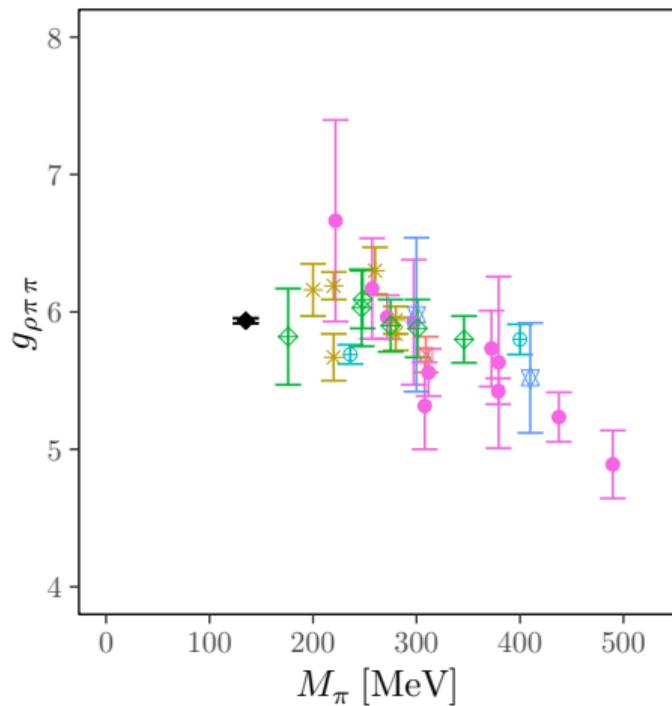

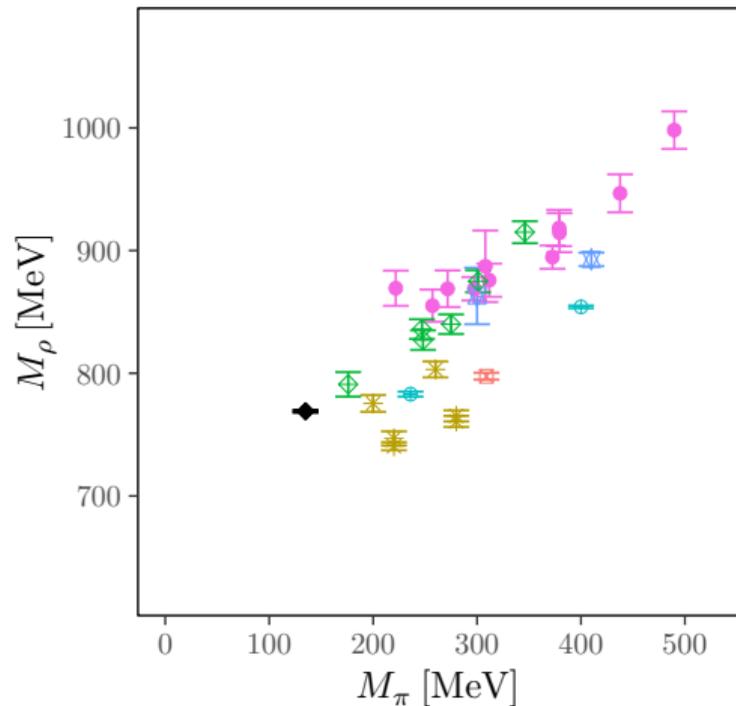

- ▶ Long extrapolation (lowest  $M_\pi = 280 \text{ MeV}$ )
- ▶ Perhaps parametrization of Breit-Wigner introduces underestimated width?

# Our phase shift with experiment

Protopopescu et al. 1973, PRD 7, 1279

## Comparison to other lattice publications

- Legend:
- Alexandrou et al. (red square with cross)
  - Andersen et al. (yellow asterisk)
  - Experiment (black diamond)
  - Fu et al. (MILC) (green diamond with cross)
  - HadSpec (cyan circle with cross)
  - PACS-CS (blue square with cross)
  - This work (magenta circle)

# Summary & Outlook

## Summary:

- ▶ Chiral and continuum extrapolation of  $\rho$  mass and width
- ▶ Lattice artifacts not resolvable
- ▶ Mass agrees with experiment, width two standard deviations too low

## Outlook:

- ▶ Global fit from unitarized  $\chi$ PT:  
IAM phase shift fit at NLO and NNLO
- ▶ Ensemble with physical  $M_\pi$
- ▶ Including higher partial waves

# Energies to phase shifts

Göckeler et al. 2012 [1206.4141]

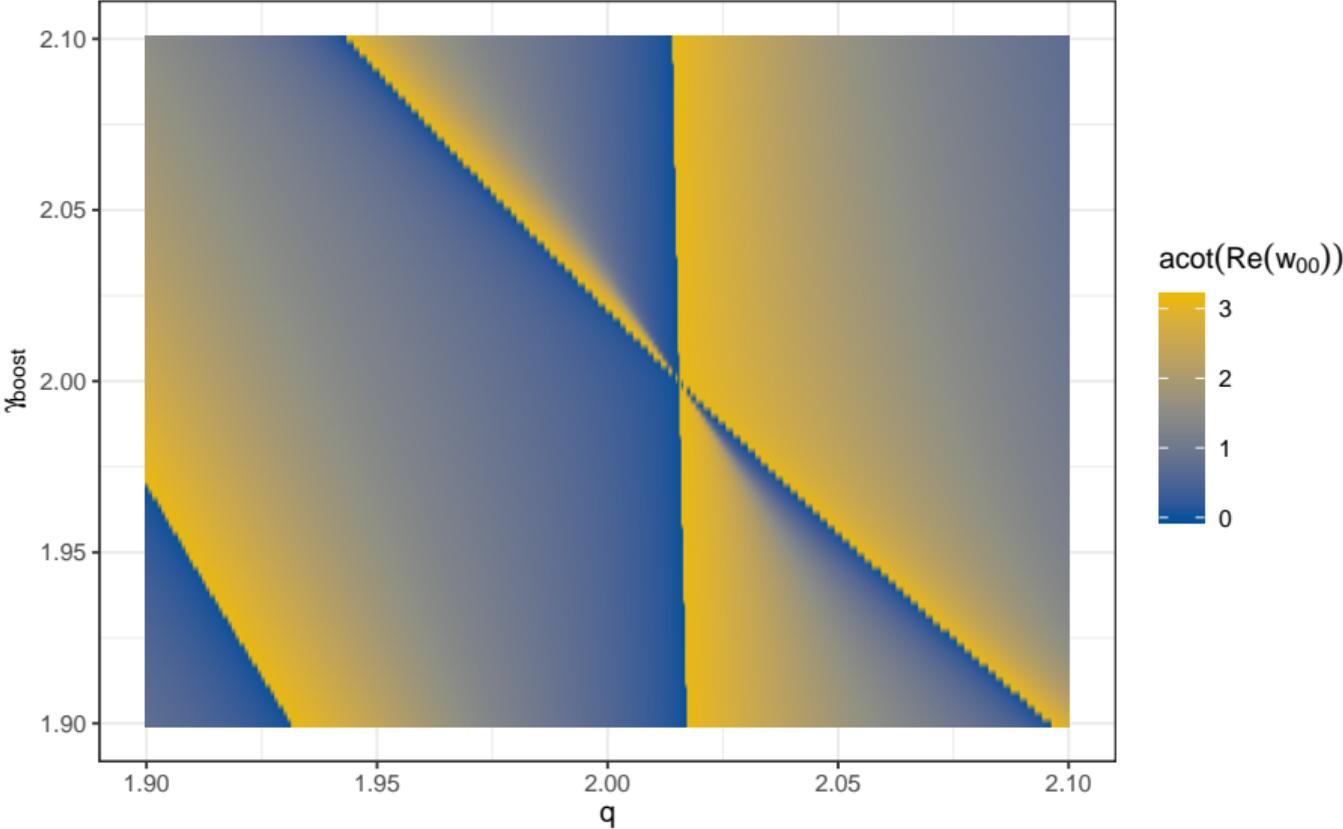

Relative momentum

$$k = \frac{E_{\text{CM}}^2}{4} - M_\pi^2$$

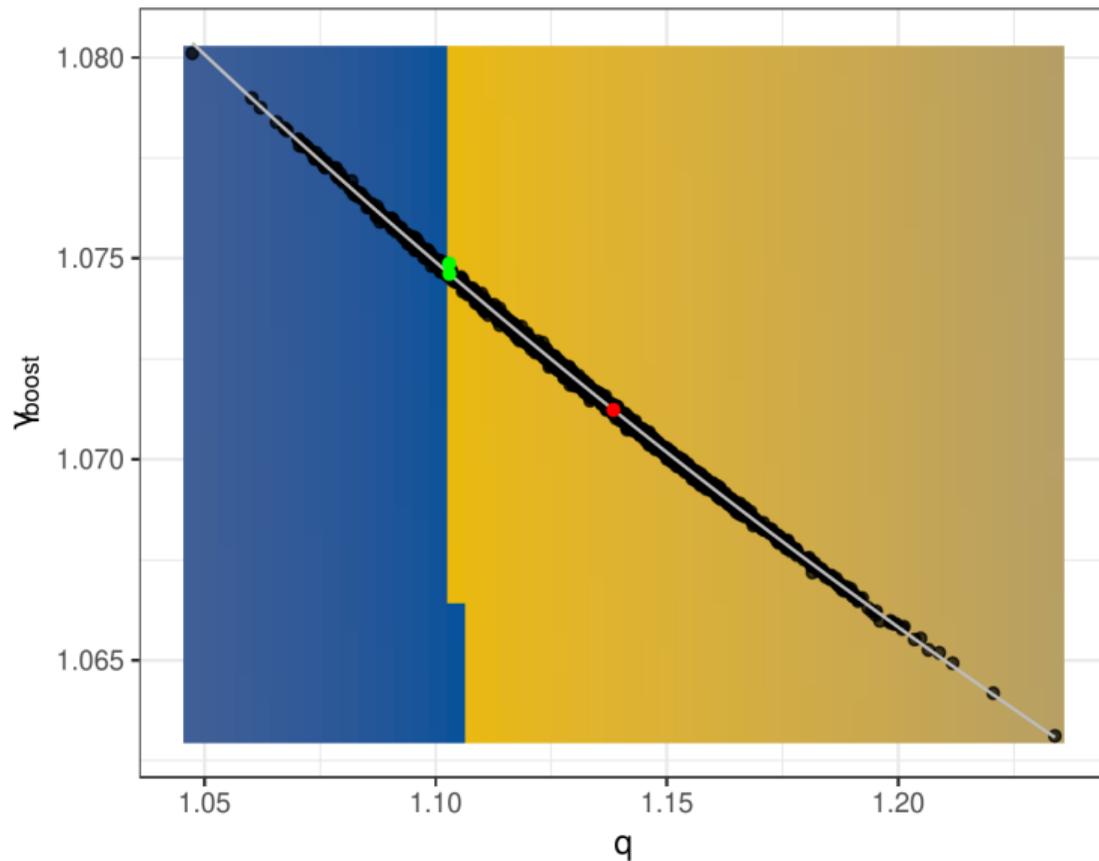

$$w_{lm}(q, \gamma) = \frac{1}{\pi^{3/2} \sqrt{2l+1} \gamma^{-1} q^{-l-1} \mathcal{Z}_{lm}(1, q^2)}, \quad q = k \frac{L}{2\pi}$$

Singularities of  $w_{lm}(q, \gamma)$  at non-interacting energy levels

# Singularity structure in Lüscher's Zeta function ( $d^2 = 1$ )

## Singularity crossing with bootstrap samples

black bootstrap distribution  
red central value  
green singularity crossing  
gray central  $M_\pi$

- ▶ Bootstrap distribution is wide
- ▶ Crossing unphysical
- ▶ Use jackknife
