Lattice 2019
June 16-22, 2019

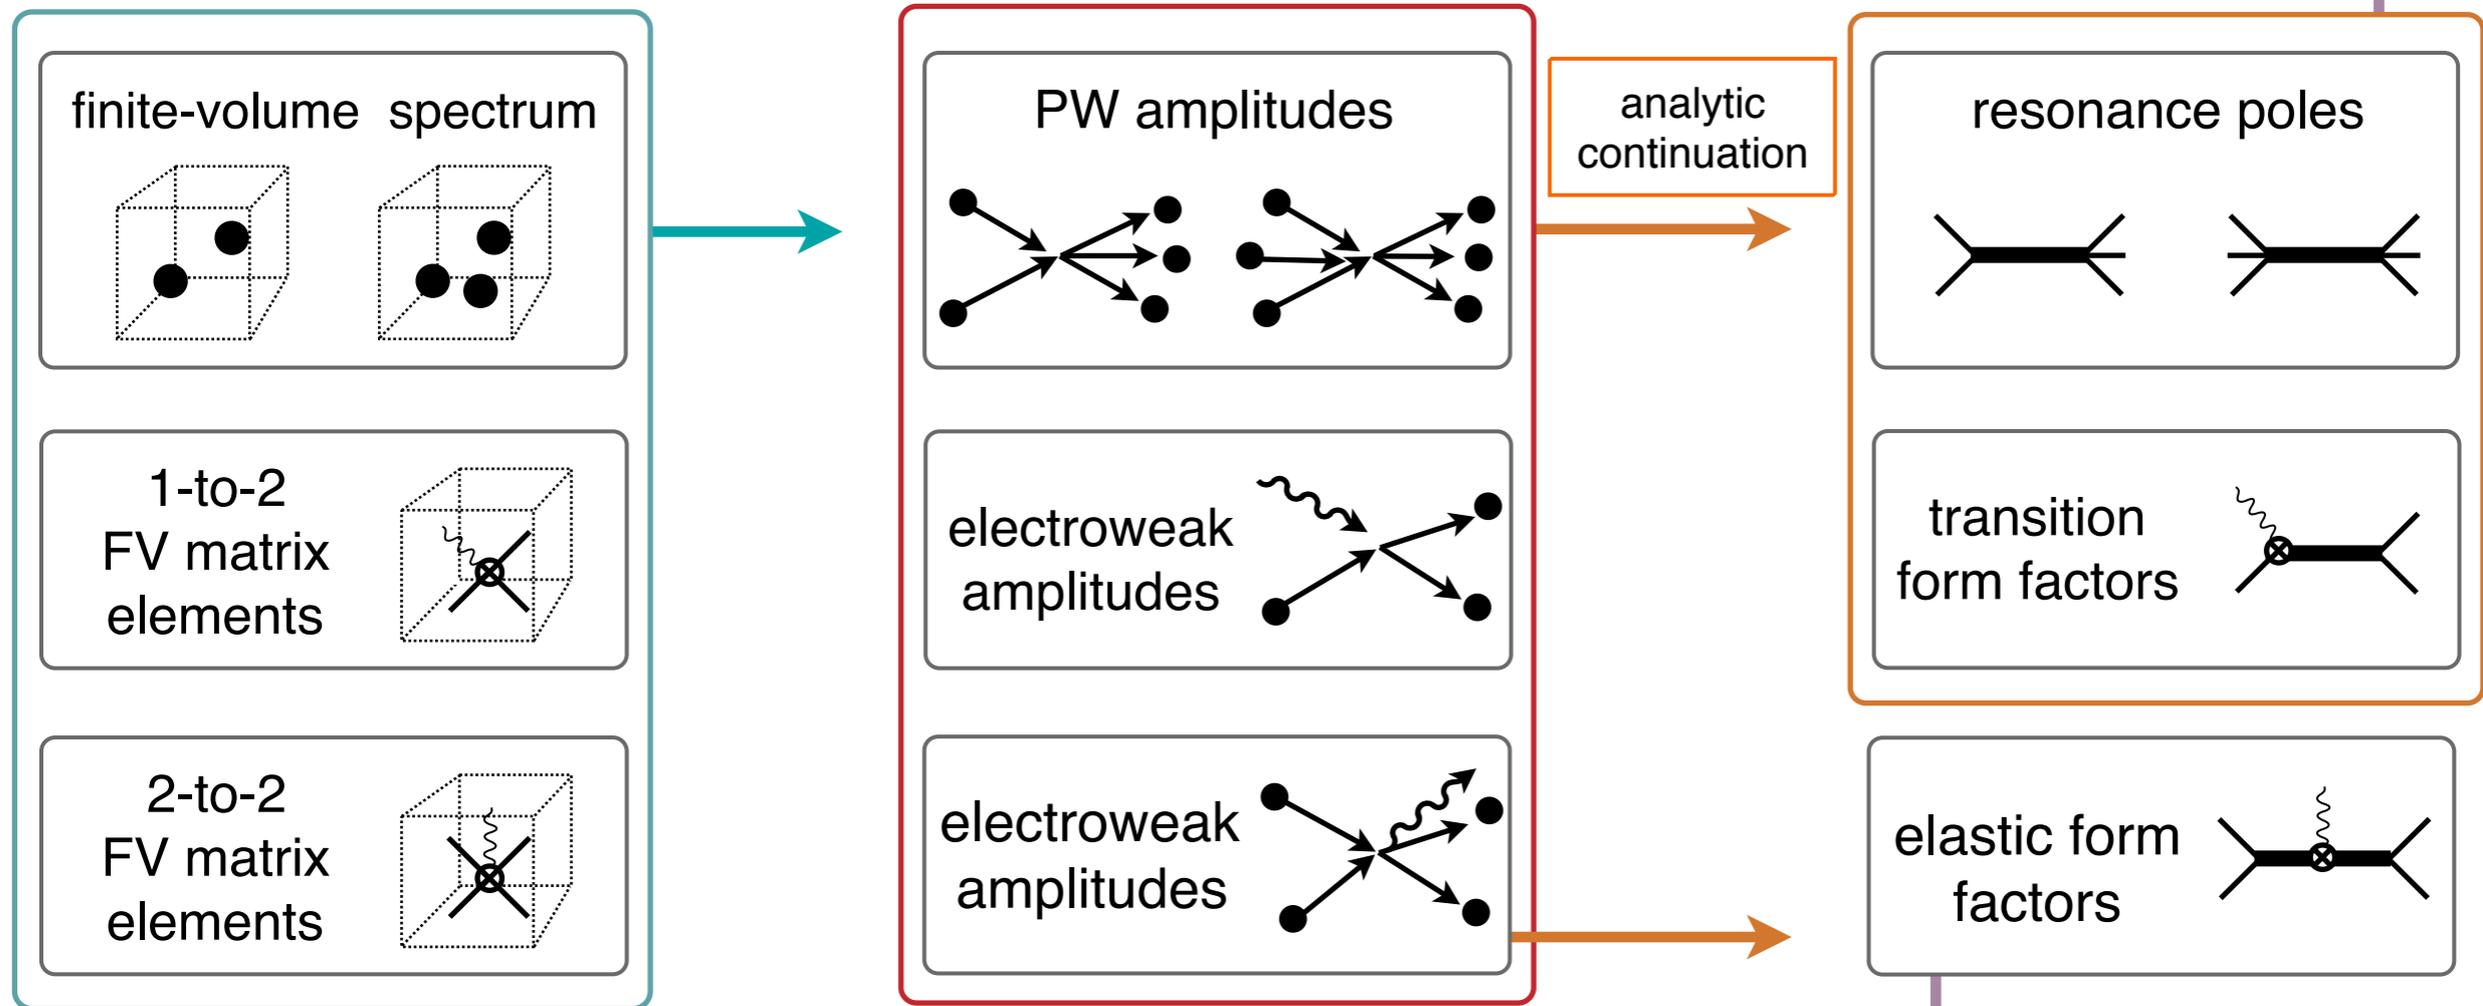

Structure of composite states

- Have seen a plethora of studies determining hadronic bound-states/ resonances from QCD
- How can we systematically determine their structure?
- Experimentally, form-factors, charge radii, pdfs, ..., give us insight
- Can we determine these in Lattice QCD for resonances/ bound states?

Roadmap

lattice QCD

identification of

- states [masses & widths],
- production/decay mechanisms

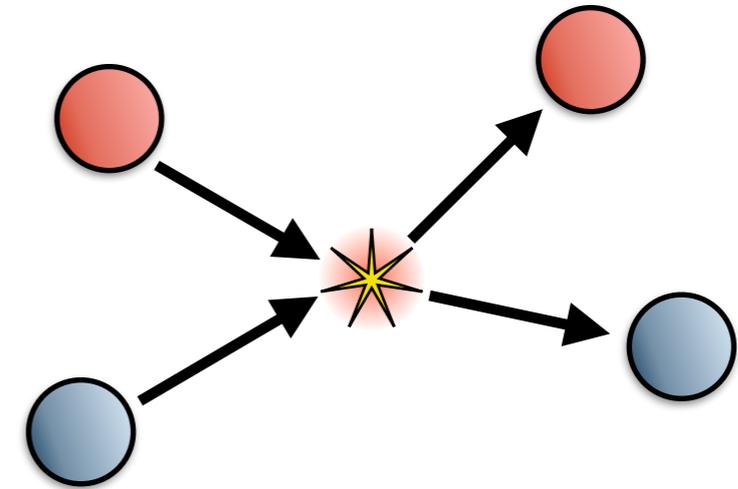

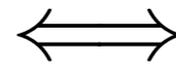

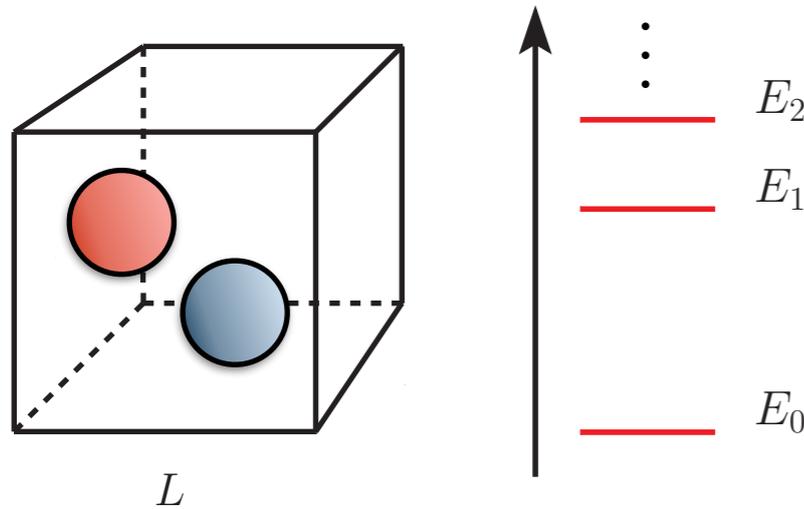

Structure & nature of states

- Form-factors, charge radii
- pdfs

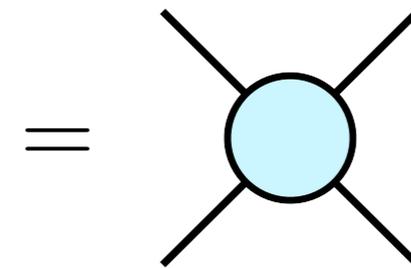

Spectroscopy

Lüscher Quantization Condition

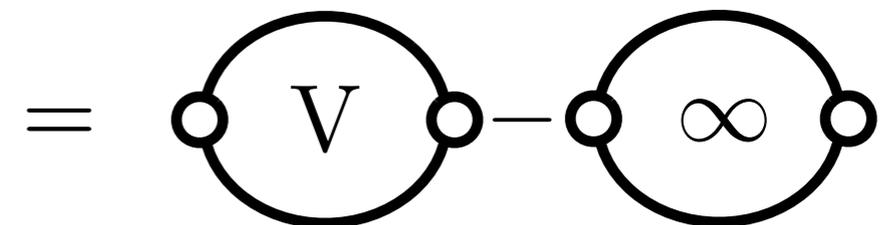

$$\det [1 + \mathcal{M}(E_n^*) F(P_n; L)] = 0$$

\mathcal{M} = Scattering amplitude

F = Finite volume function

- Lüscher (1986, 1991)
- Rummukainen & Gottlieb (1995)
- Kim, Sachrajda, & Sharpe/Christ, Kim & Yamazaki (2005)
- Feng, Li, & Liu (2004)
- Hansen & Sharpe / Briceño & Davoudi (2012)
- Briceño (2014)

Spectroscopy

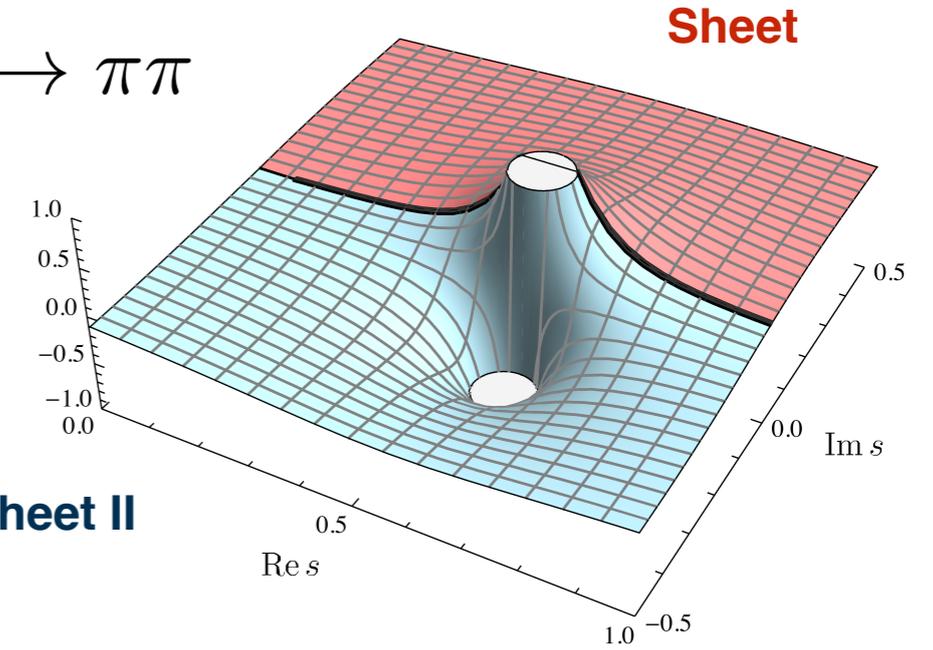

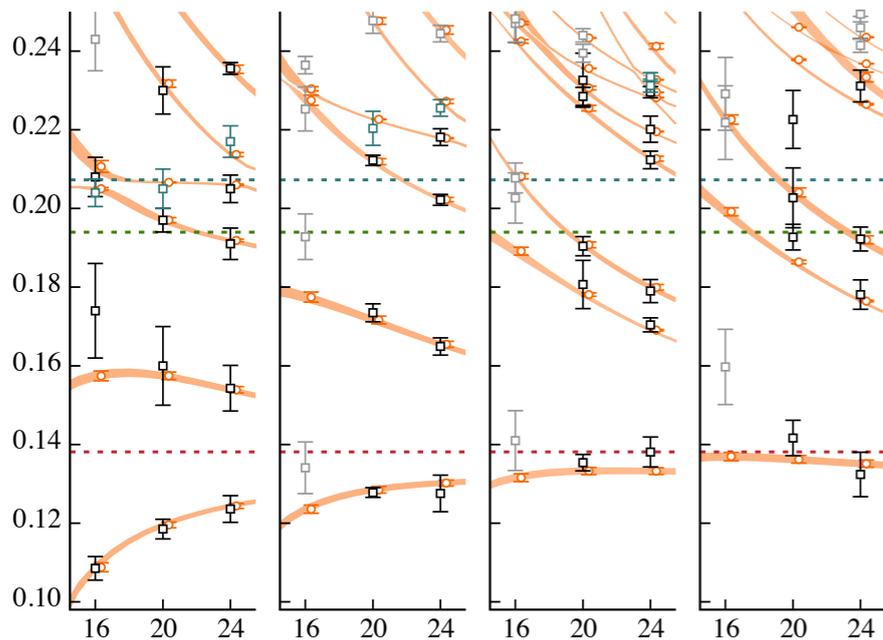

- Many examples of successful determination of resonances

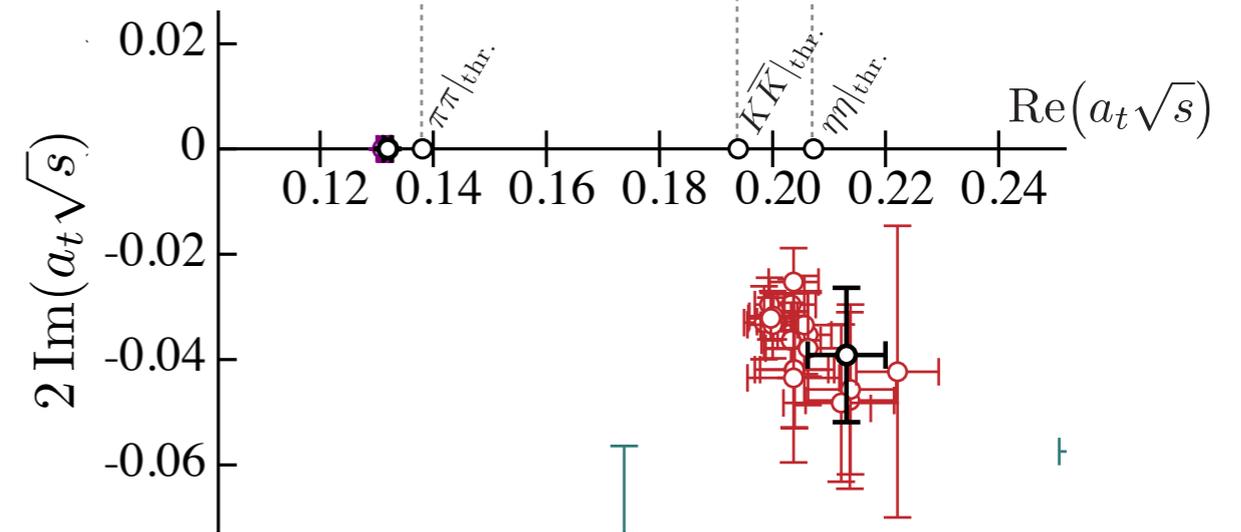

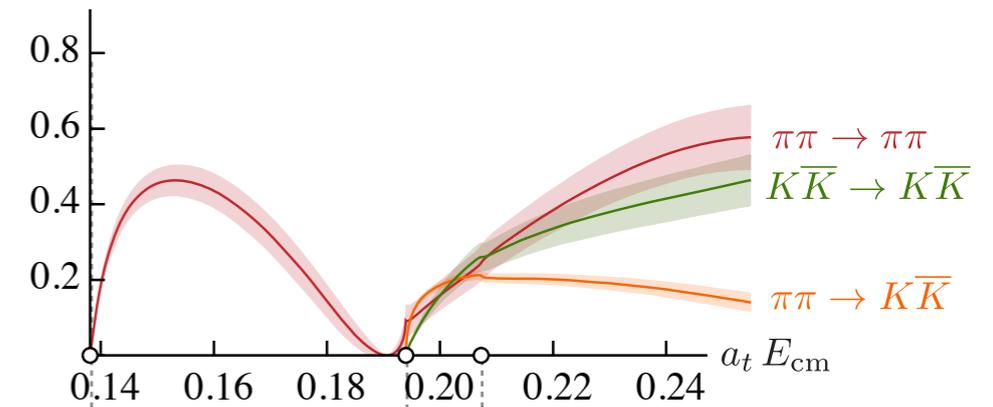

$$i\mathcal{M} = i\mathcal{K} \frac{1}{1 - i\rho\mathcal{K}}$$

$$\mathcal{M} \sim \frac{g^2}{s - s_{\text{res}}}$$

had spec

Sheet II

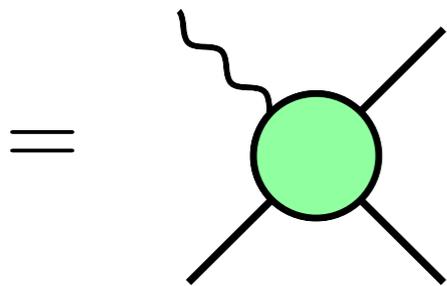

Briceño, Dudek, Edwards, & Wilson

Transition Amplitudes

- Investigate production of resonances via external currents $\pi\gamma^* \rightarrow \pi\pi$

$$\langle \mathbf{2} | \mathcal{J} | \mathbf{1} \rangle_L \sim A\sqrt{\mathcal{R}}$$

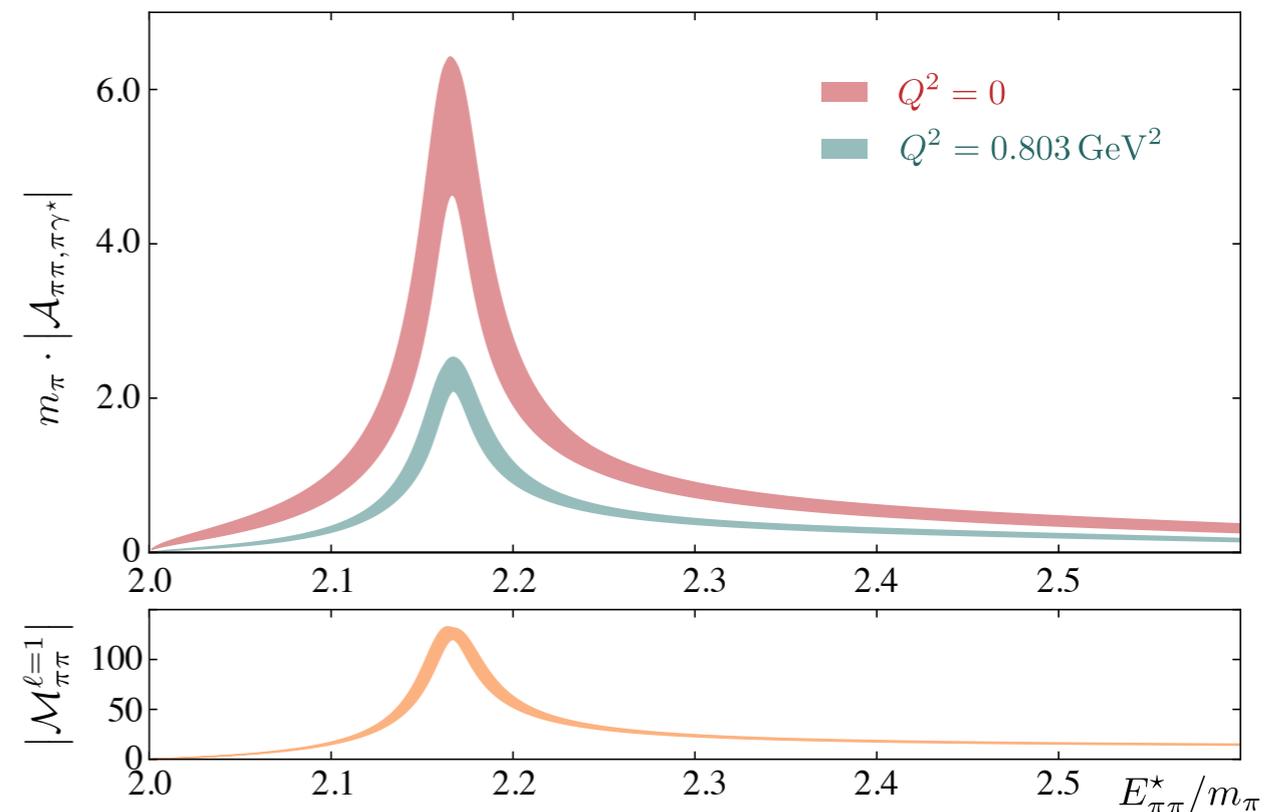

$A =$ Transition amplitude

- Lellouch & Lüscher (2000)
- Kim, Sachrajda, & Sharpe
- Christ, Kim & Yamazaki (2005)
- Hansen & Sharpe (2012)
- Briceño, Hansen Walker-Loud (2014)
- Briceño & Hansen (2015)
- ... and many others

Lellouch-Lüscher factor

$$\mathcal{R}(P_n; L) = \lim_{E \rightarrow E_n} \left[\frac{(E - E_n)}{F^{-1}(P, L) + \mathcal{M}(s)} \right]$$

Briceño, Dudek, Edwards, Shultz, Thomas, & Wilson

Two-Hadron Form Factors

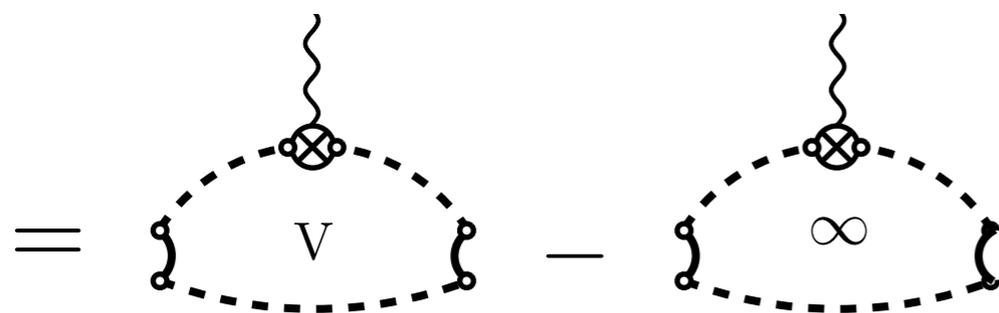

- Extend ideas to external currents coupling to two-hadron systems
- Systematic method to study structure of resonances/ bound states

$$\pi\pi\gamma^* \rightarrow \pi\pi$$

$$\langle \mathbf{2} | \mathcal{J} | \mathbf{2} \rangle_L \sim \mathcal{R} \cdot [\mathcal{W}_{\text{df}} + f \mathcal{M} G \mathcal{M}]$$

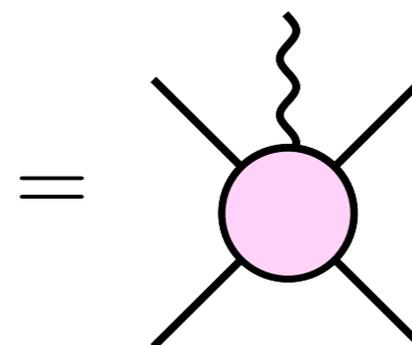

$f =$ Single hadron form factor

$G =$ New finite volume function

Generalized form factor

$$\mathcal{W}_{\text{df}} = \frac{1}{1 - \mathcal{K}_f i \rho_f} \mathcal{F} \frac{1}{1 - i \rho_i \mathcal{K}_i}$$

- Bernard, Hoja, Meißner, Rusetsky (2012)
- Briceño, Hansen (2016)
- Baroni, Briceño, Hansen, and Ortega-Gama (2018)

Finite Volume function — G

- New finite volume function — G

(Here S-wave)

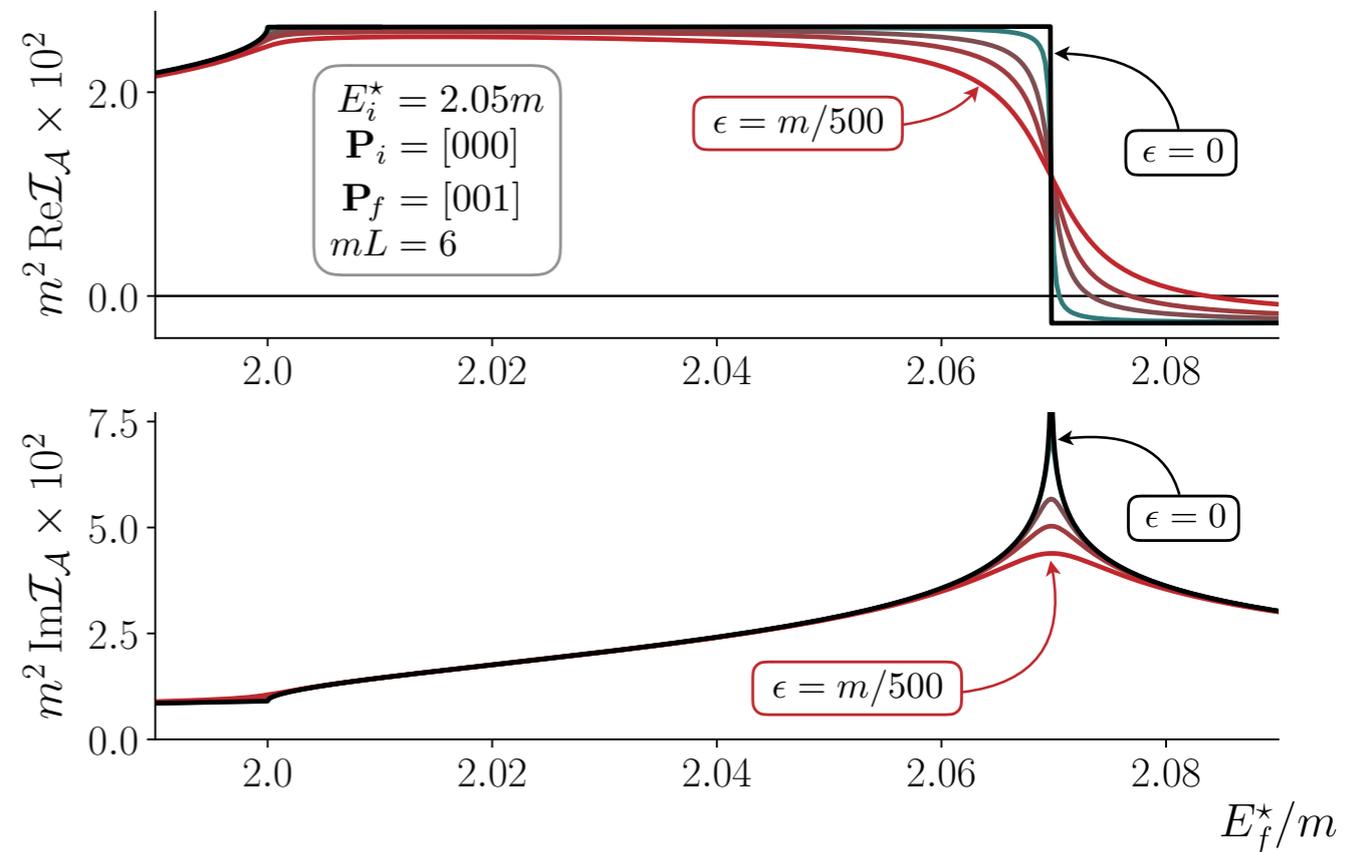

$$G^{\mu_1 \dots \mu_n}(P_f, P_i; L) = \left[\frac{1}{L^3} \not\int_{\mathbf{k}} \right] \frac{k^{\mu_1} \dots k^{\mu_n}}{2\omega_{\mathbf{k}}((P_f - k)^2 - m^2 + i\epsilon)((P_i - k)^2 - m^2 + i\epsilon)} \Big|_{k^0 = \omega_{\mathbf{k}}}$$

$$G^{\mu_1 \dots \mu_n}(P_f, P_i; L) = \text{Diagram with } V \text{ and } \infty \text{ labels}$$

- Analytic behavior understood

- Threshold cusp
- Triangle singularities

- Baroni, Briceño, Hansen, and Ortega-Gama (2018)

Finite Volume function — G

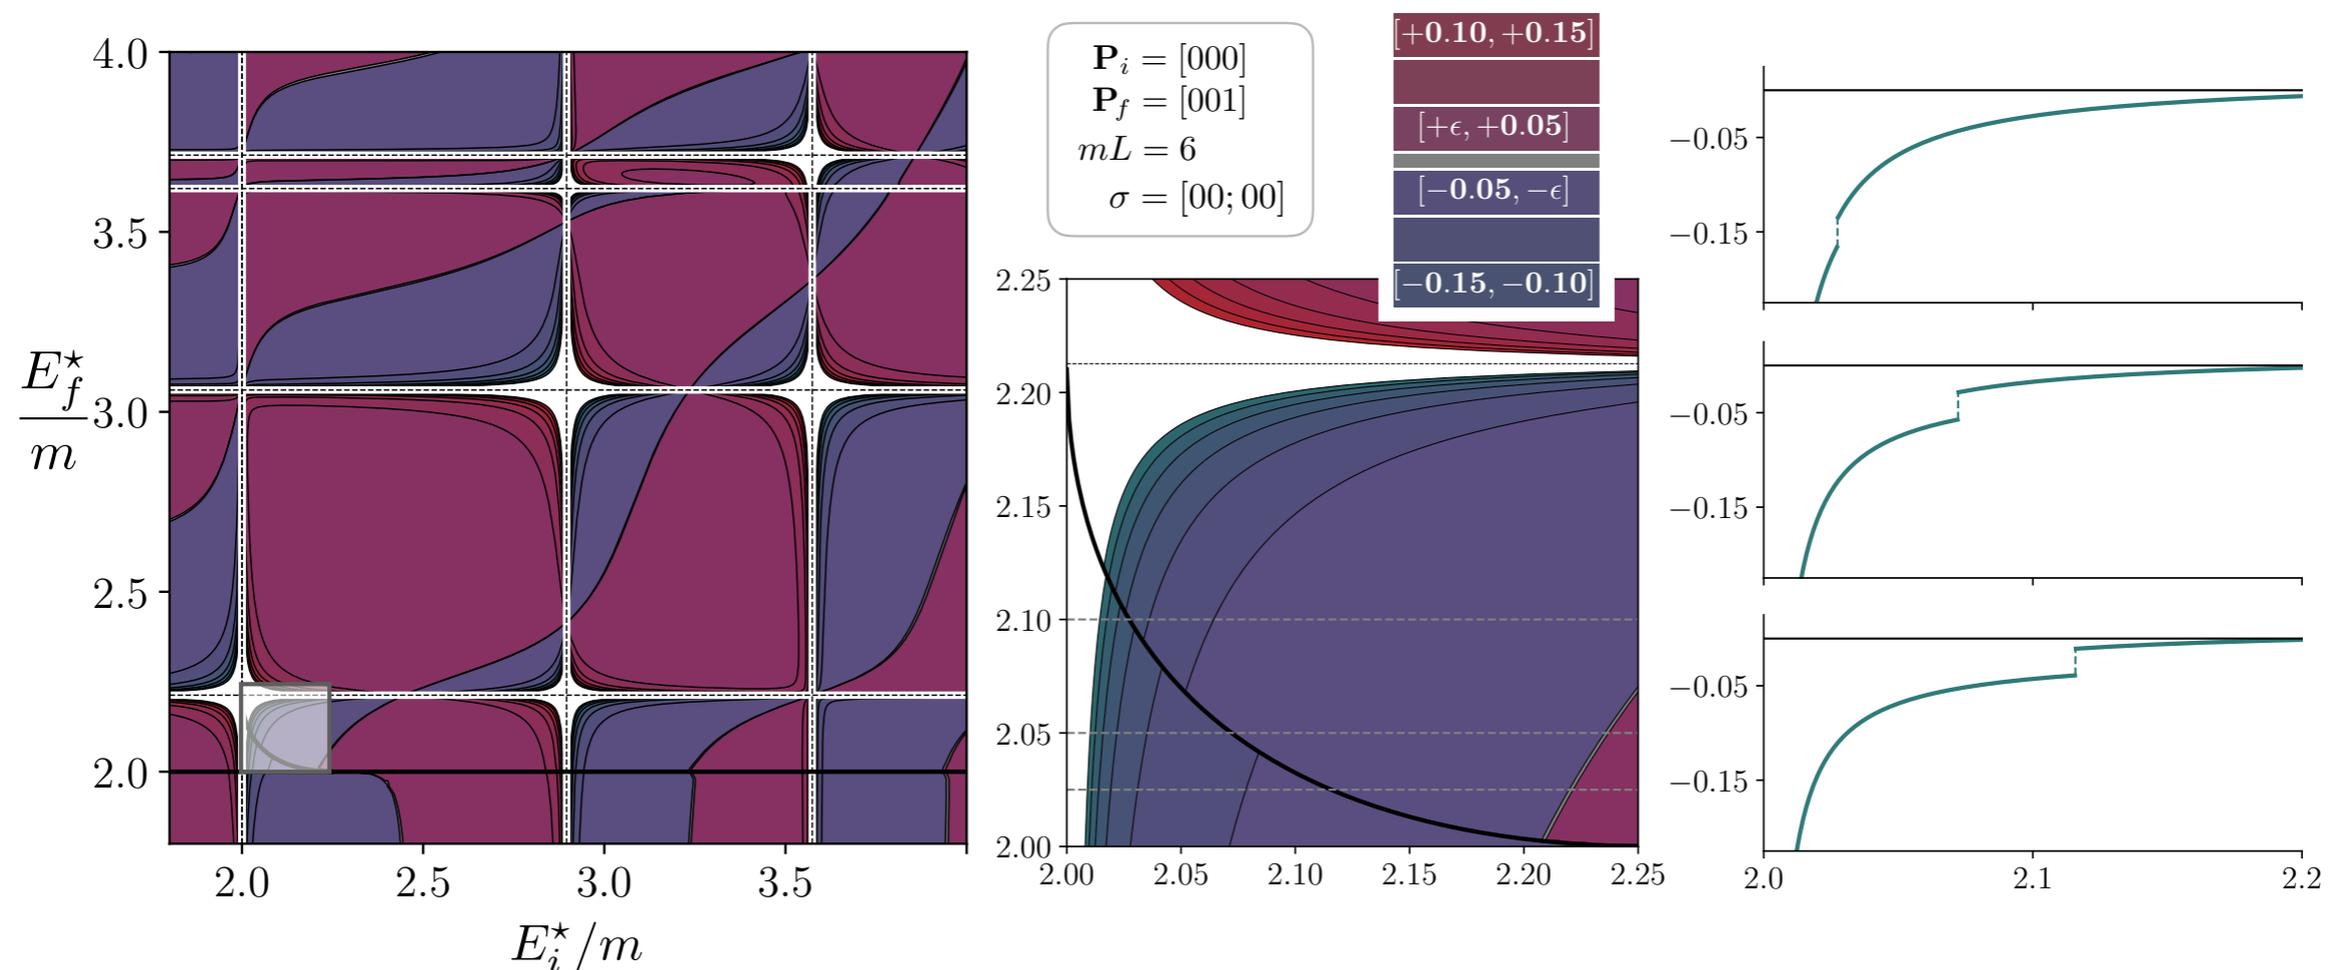

- New finite volume function — G

(Here S-wave)

$$G^{\mu_1 \dots \mu_n}(P_f, P_i; L) = \left[\frac{1}{L^3} \sum_{\mathbf{k}} \right] \frac{k^{\mu_1} \dots k^{\mu_n}}{2\omega_{\mathbf{k}}((P_f - k)^2 - m^2 + i\epsilon)((P_i - k)^2 - m^2 + i\epsilon)} \Big|_{k^0 = \omega_{\mathbf{k}}}$$

$$G^{\mu_1 \dots \mu_n}(P_f, P_i; L) = \text{Diagram with } V \text{ and } \infty \text{ labels}$$

The diagram shows two dashed-line loops representing volume integrals. The left loop contains a vertex labeled 'V' with a wavy line and a cross. The right loop contains an infinity symbol '∞' with a wavy line and a cross. A minus sign is placed between the two loops.

$2+J \rightarrow 2$ Matrix Elements

- Infinite volume matrix elements $\langle \mathbf{2} | \mathcal{J} | \mathbf{2} \rangle_\infty = \mathcal{W}$
- Remove long-range effects on external legs

$$\mathcal{W}_{\text{df}} = \text{Diagram 1} = \mathcal{W} - \text{Diagram 2} - \text{Diagram 3}$$

- Consider simplest cases — S-wave systems coupling to vector and scalar currents
 - Vector current — Charge distribution
 - Scalar current — Compactness of constituents

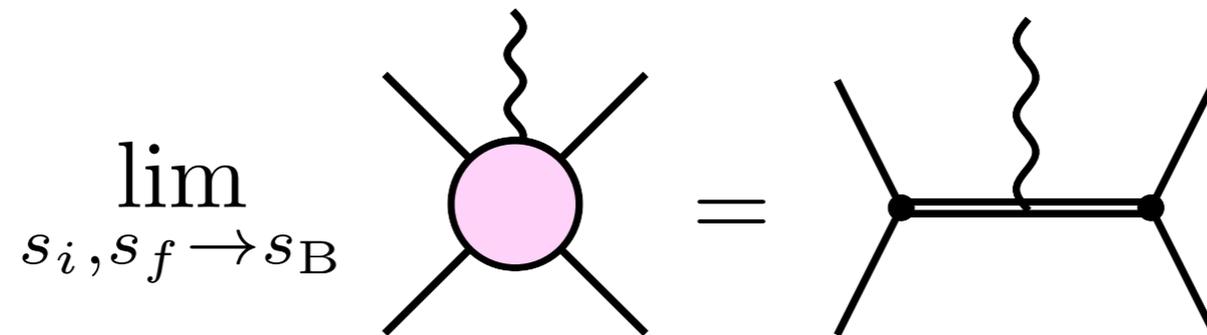

Vector $\mathcal{W}_{\text{df},L}^\mu = \mathcal{W}_{\text{df}}^\mu + f \mathcal{M} [(P_i + P_f)^\mu G - 2G^\mu] \mathcal{M}$

Scalar $\mathcal{W}_{\text{df},L} = \mathcal{W}_{\text{df}} + f \mathcal{M} G \mathcal{M}$

Matrix elements of bound states

- Near the bound state pole

$$\lim_{s_i, s_f \rightarrow s_B} \mathcal{W}_{\text{df}}^\mu(P_f, P_i) = ig \frac{i}{s_f - s_B} (P_i + P_f)^\mu F_B(Q^2) \frac{i}{s_i - s_B} ig$$

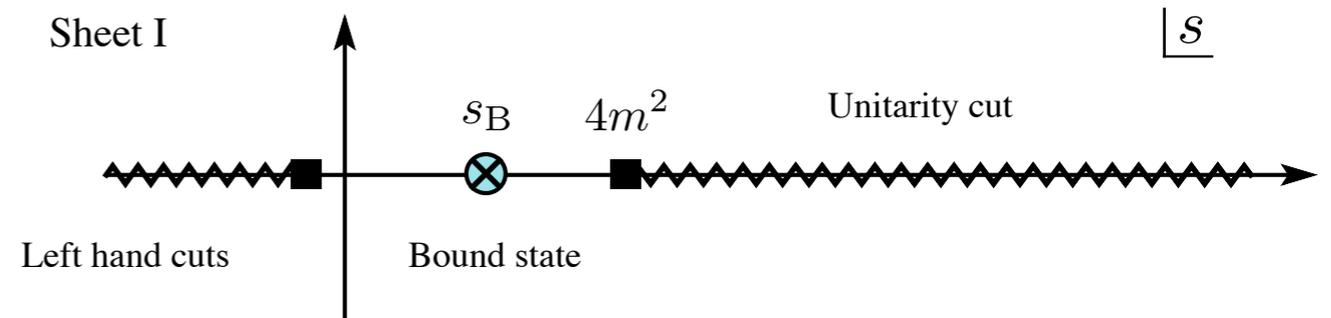

- Consistency of the electric charge $F_B(0) = Q_0$

- In the finite volume $\langle \mathbf{2} | \mathcal{J} | \mathbf{2} \rangle_L \sim \mathcal{W}_{\text{df},L} \cdot \mathcal{R}$

- Require — Finite volume spectra of bound state
 - Analytic representation for scattering amplitude
 - Analytic parameterization for form-factor

Bound States

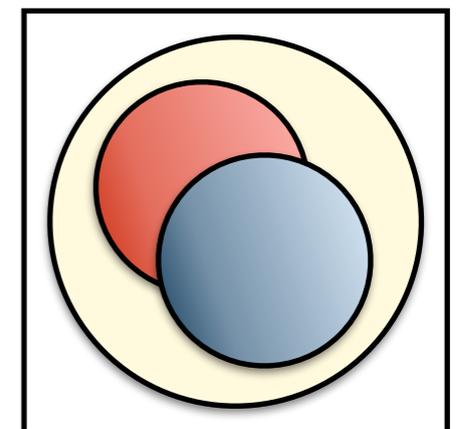

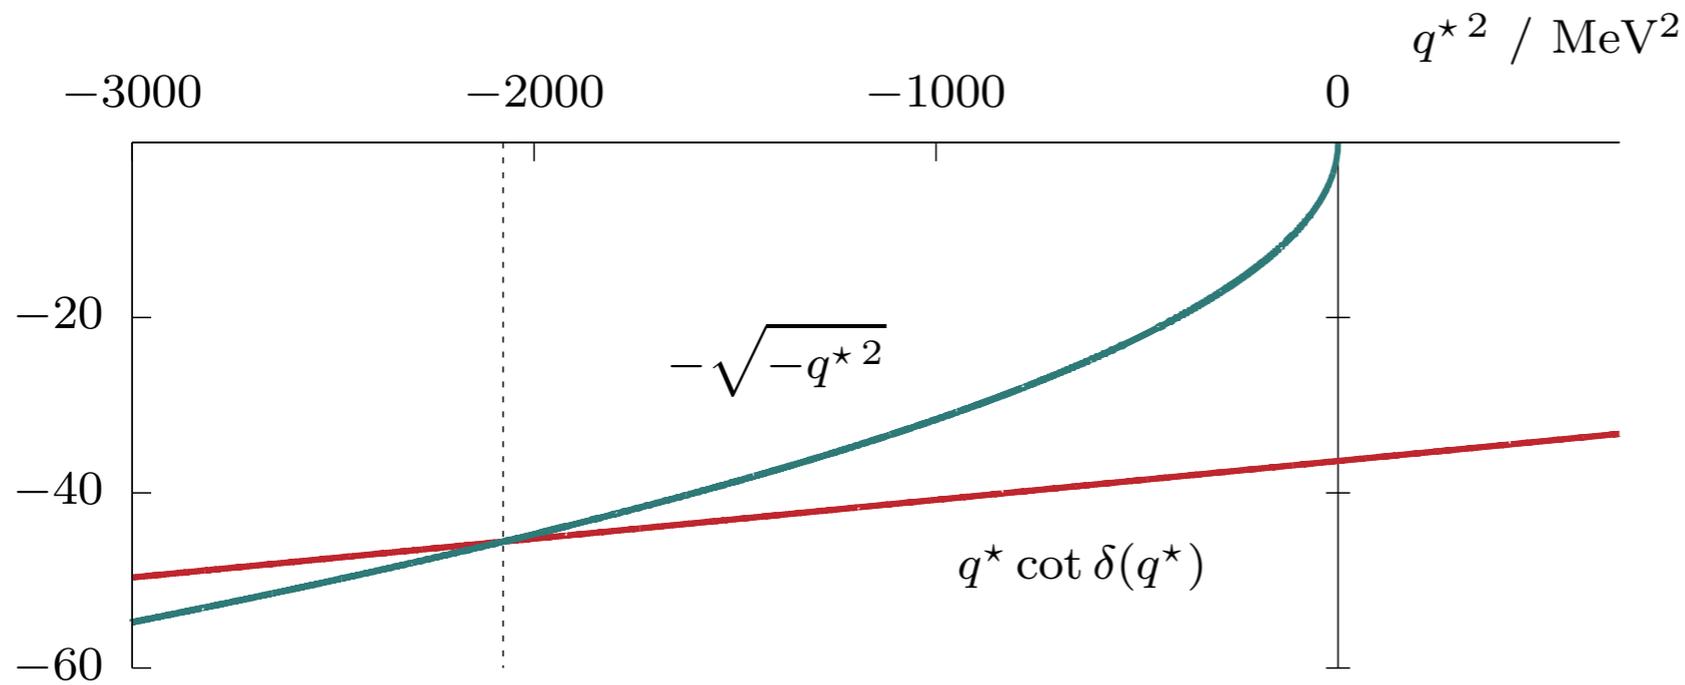

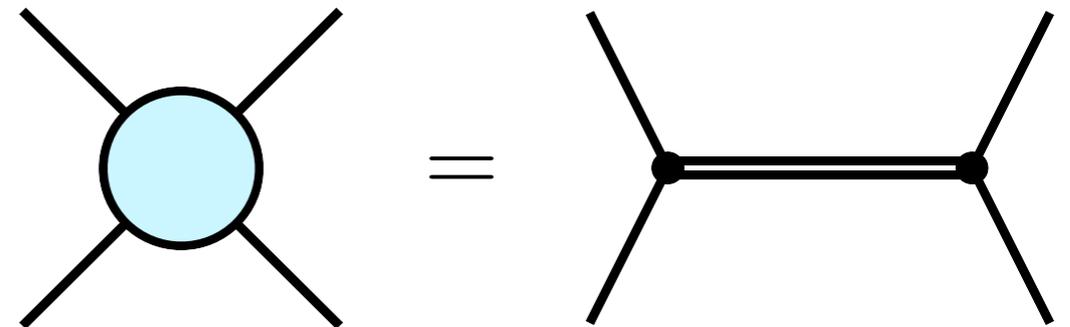

- Apply framework to an S -wave bound state
- Use deuteron in pn -scattering as toy example

$$\lim_{s \rightarrow s_B} \mathcal{M}(s) = \frac{(ig)^2}{s - s_B}$$

$$q^* \cot \delta(q^*)|_{q^* = i\kappa_B} + \kappa_B = 0$$

$$\lim_{s \rightarrow s_B}$$

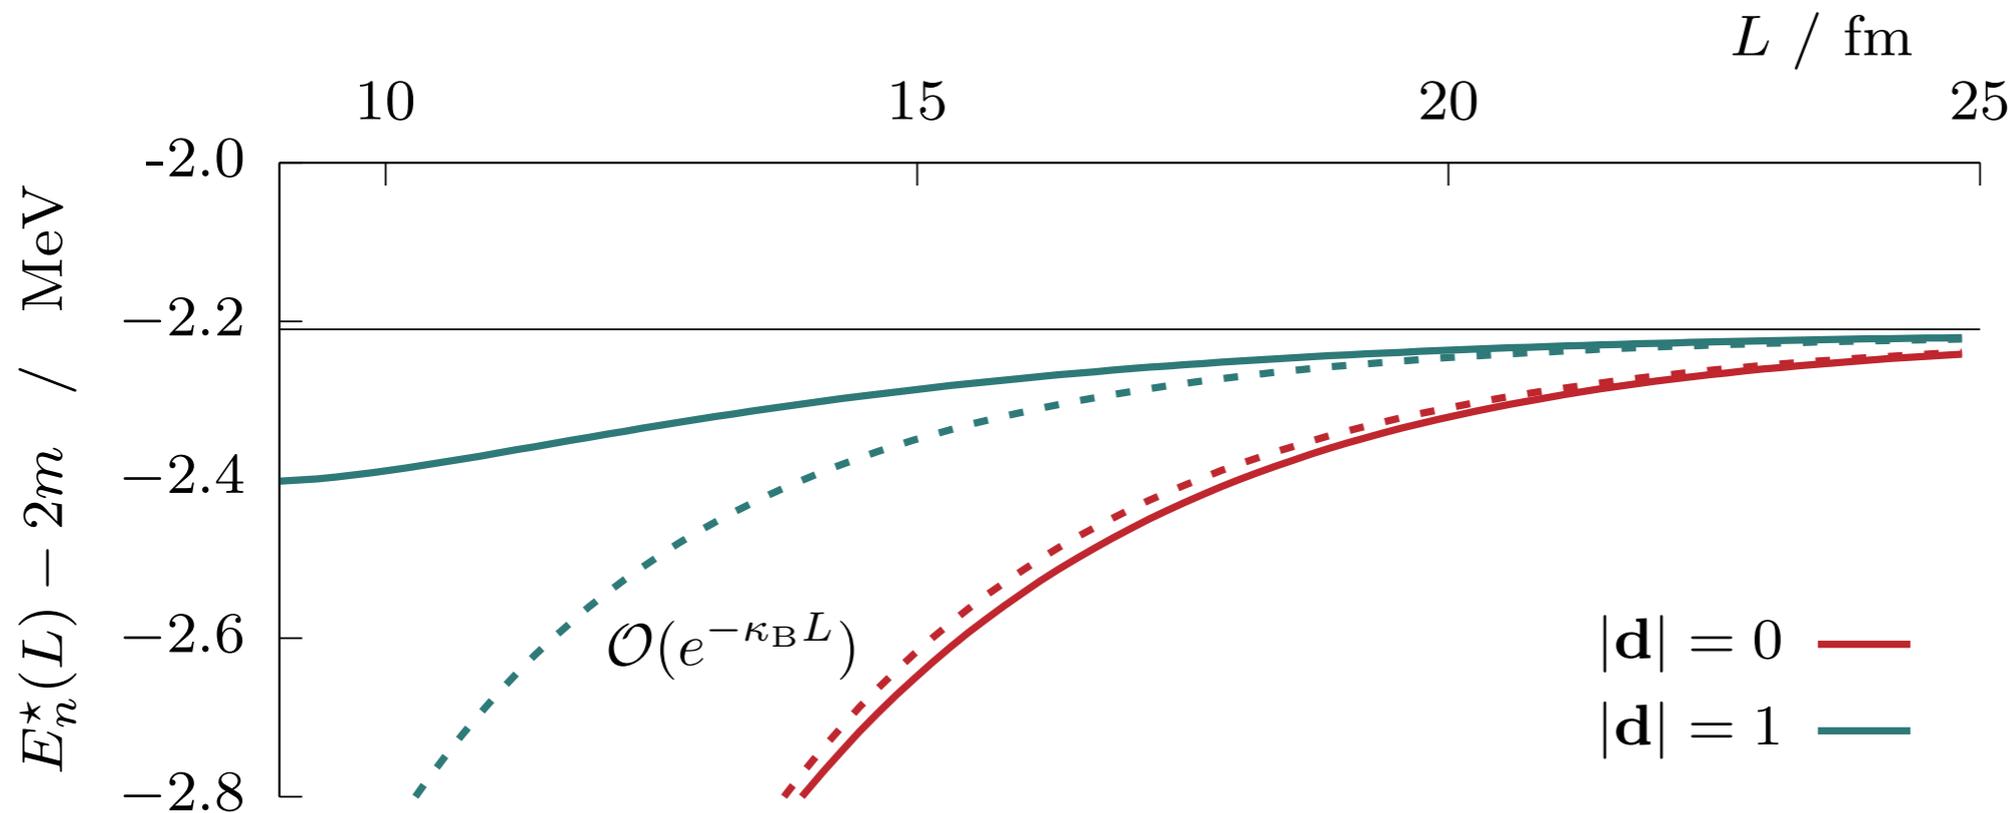

L

Finite volume spectrum

- Bound state exponentially close to Lüscher pole

$$\delta s_B = \mathcal{O}(e^{-\kappa_B L})$$

$$\mathcal{M}^{-1}(s_n) = -F(P_n; L) \implies s_n = s_B + \delta s_B$$

(Here S-wave)

- Davoudi & Savage (2011)

$$F(P; L) = \left[\frac{1}{L^3} \sum_{\mathbf{k}} \right] \frac{1}{2\omega_{\mathbf{k}}((P - k)^2 - m^2 + i\epsilon)} \Big|_{k^0 = \omega_{\mathbf{k}}}$$

Matrix elements of vector currents

- First investigate S -wave system coupling to a vector current

- At zero-momentum transfer, matrix element defines the charge — $\langle \mathbf{2} | \mathcal{J}^{\mu=0} | \mathbf{2} \rangle_L \xrightarrow{Q^2 \rightarrow 0} \frac{Q_0}{L^3}$

- Deeply bound state — Finite volume dependence vanishes $\kappa_B L \rightarrow \infty$

- Lellouch-Lüscher factor
$$\mathcal{R}^{-1} = (\mathcal{M})' = -\frac{2Eg^2}{(s - s_B)^2}$$

- Matrix element
$$\langle \mathbf{2} | \mathcal{J}^\mu | \mathbf{2} \rangle_L = \frac{1}{2\sqrt{E_i E_f} L^3} (P_i + P_f)^\mu F_B(Q^2)$$

- Temporal component at zero-momentum transfer

$$\langle \mathbf{2} | \mathcal{J}^\mu | \mathbf{2} \rangle_L \xrightarrow{Q^2 \rightarrow 0} \frac{F_B(0)}{L^3} \implies F_B(0) = Q_0 \quad \checkmark$$

First check that formalism reproduces expectations

Matrix elements of vector currents

- Next, consider a shallow bound state

- Require that matrix element has no non-trivial volume dependence $\langle \mathbf{2} | \mathcal{J}^{\mu=0} | \mathbf{2} \rangle_L \xrightarrow{Q^2 \rightarrow 0} \frac{Q_0}{L^3}$

- Should see volume independence

- Formalism yields the matrix element

$$\langle \mathbf{2} | \mathcal{J} | \mathbf{2} \rangle_L = \frac{1}{L^3} \frac{1}{(i\rho\mathcal{K})' - (\mathcal{K}F)'} \left[\frac{\mathcal{F}^\mu}{\mathcal{K}} + Q_0 \mathcal{K} \left(2P^\mu G - 2G^\mu \right) \right]$$

- Lellouch-Lüscher factor simplifies

Same finite volume piece!

$$(i\rho\mathcal{K})' - (\mathcal{K}F)' = \frac{\mathcal{K}}{\mathcal{M}^2} \frac{d}{dE} \mathcal{M} + \mathcal{K} \left(2E G - 2G^{\mu=0} \right) \quad ()' = \frac{d}{dE}$$

- Constrained form-factor at zero-momentum transfer

$$\mathcal{F}^{\mu=0} = Q_0 \frac{\mathcal{K}^2}{\mathcal{M}^2} \frac{d}{dE} \mathcal{M} \implies \mathcal{W}_{\text{df}}^{\mu=0} = Q_0 \frac{d}{dE} \mathcal{M} \quad \checkmark$$

Recover WTI!

Scalar Currents - non-trivial volume dependence

- Compare vector current to scalar current

- Deeply bound states — $\langle \mathbf{2} | \mathcal{J} | \mathbf{2} \rangle_L = \frac{F_B(0)}{2EL}$

Scalar current form factor

- Shallow bound states — look at leading order effects $\delta s_B = \mathcal{O}(e^{-\kappa_B L})$

- Look at leading order effects

$$\langle \mathbf{2} | \mathcal{J} | \mathbf{2} \rangle_L = \frac{F_B(0)}{2EL} \left[1 + \delta s_B (\dots) + \frac{g^2}{E} G^{\mu=0} \right] + \mathcal{O}(\delta s_B^2)$$

Infinite volume quantities

Non-trivial volume dependence!

$$G^{\mu=0}(P_B; L) = \mathcal{O}(e^{-\kappa_B L})$$

- Mass known to have finite volume dependence — manifestation in matrix elements

- Similar features for general tensor currents

Third non-trivial check

Summary and Outlook

- Formalism to study structure of resonant/ bound state systems
- First studies to S -wave bound-states — provide consistency checks
 - Volume independence of charge in electromagnetic form-factors
 - Recover infinite volume constraints via WTI
 - Volume dependence of scalar source — probe mass distribution
- Near future applications
 - Threshold expansion — continued consistency checks against results in literature
 - Numerical applications, e.g. $\pi\pi\gamma^* \rightarrow \pi\pi$
- Near future Formal developments
 - Extend formalism to particles with spin
