

$B \rightarrow D^*$ form factors, $R(D^*)$, and $|V_{cb}|$

Andrew Lytle
INFN Roma Tor Vergata

18.06.19
Lattice 2019
Wuhan, China

Intro & Motivation

- Semileptonic $B \rightarrow D^{(*)}l\nu$ decays: used to extract $|V_{cb}|$.
- Long-standing tension $\sim 3\sigma$ in inclusive/exclusive determinations.
- Observables $R(D^{(*)})$ have persistent $2 - 3\sigma$ tensions with SM.

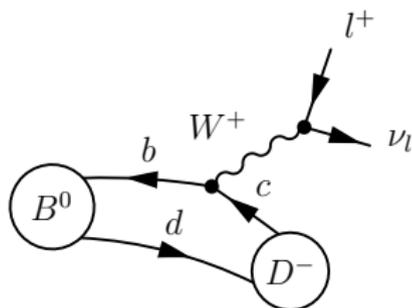

What is the role of lattice QCD in resolving or understanding these tensions?

More generally, what is the outlook for $b \rightarrow c$ semileptonic transitions.

Outline

1. Intro & Motivation.
2. Theoretical framework.
3. Expt'l prospects @ Belle-II & LHCb
4. Status of $B_{(s)} \rightarrow D_{(s)}^{(*)} l \nu$ lattice calculations.
5. Conclusions & Future outlook.

$B \rightarrow D^{(*)} l \nu$

1104.5484

$$\frac{d\Gamma}{dw}(B \rightarrow D) = (\text{known}) |V_{cb}|^2 (w^2 - 1)^{3/2} |\mathcal{G}(w)|^2$$
$$\frac{d\Gamma}{dw}(B \rightarrow D^*) = (\text{known}) |V_{cb}|^2 (w^2 - 1)^{1/2} \chi(w) |\mathcal{F}(w)|^2$$

$$w = v_B \cdot v_{D^{(*)}} = \frac{M_B^2 + M_{D^{(*)}}^2 - q^2}{2M_B M_{D^{(*)}}}$$

At zero recoil $w = 1$, and $\mathcal{F}(1) = h_{A_1}(1)$.

$B \rightarrow D^{(*)} l \nu$ matrix elements

The form factors \mathcal{F} and \mathcal{G} can be determined from QCD matrix elements computed on the lattice.

$$\begin{aligned}\frac{\langle D | V^\mu | B \rangle}{\sqrt{m_B m_D}} &= (v_B + v_D)^\mu h_+(w) + (v_B - v_D)^\mu h_-(w) \\ \frac{\langle D_\alpha^* | V^\mu | B \rangle}{\sqrt{m_B m_{D^*}}} &= \varepsilon^{\mu\nu\rho\sigma} v_B^\nu v_{D^*}^\rho \epsilon_\alpha^{*\sigma} h_V(w) \\ \frac{\langle D_\alpha^* | A^\mu | B \rangle}{\sqrt{m_B m_{D^*}}} &= i \epsilon_\alpha^{*\nu} [h_{A_1}(w)(1+w)g^{\mu\nu} - (h_{A_2}(w)v_B^\mu + h_{A_3}(w)v_{D^*}^\mu)v_B^\nu]\end{aligned}$$

At zero recoil $w = 1$, and $\mathcal{F}(1) = h_{A_1}(1)$.

$|V_{cb}|$ and the V_{cb} puzzle

- There is a long-standing tension in extractions of $|V_{cb}|$ from inclusive and exclusive semileptonic B decays, hovering at $\approx 3\sigma$.
- The most precise exclusive channel is $B \rightarrow D^* l \nu$.
- Lattice calculations are more precise near zero-recoil, whereas experimental data is suppressed here.
- To connect theory and experiment, the experimental results are extrapolated to zero recoil using HQET (CLN parameterization) and this is compared with the form factor computed at zero recoil to extract $|V_{cb}|$.

Form factor extrapolation

Experimental data traditionally analyzed in HQET framework:
Fit form factors as function of w to extract $\mathcal{F}(1)\eta_{EW}|V_{cb}|$,
compare with $h_{A_1}(1)$ from lattice to extract $|V_{cb}|$.

CLN parameterization:

$$h_{A_1}(z) = h_{A_1}(1)(1 - 8\rho^2 z + (53\rho^2 - 15)z^2 - (231\rho^2 - 91)z^3)$$

$$R_1(w) = R_1(1) - 0.12(w - 1) + 0.05(w - 1)^2$$

$$R_2(w) = R_2(1) - 0.11(w - 1) - 0.06(w - 1)^2$$

BGL parameterization uses only weak unitarity constraints: In terms of $z = (\sqrt{w+1} - \sqrt{2})/(\sqrt{w+1} + \sqrt{2})$, $z \in [0, 0.056]$:

$$f_i(z) = \frac{1}{P_i(z)\phi_i(z)} \sum_{k=0}^{n_i} a_k^i z^k$$

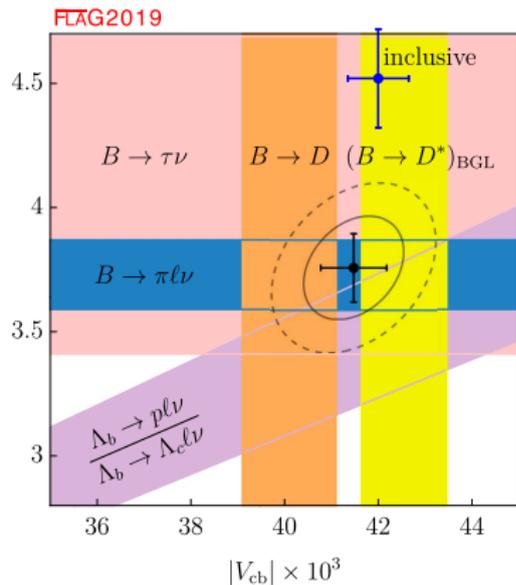

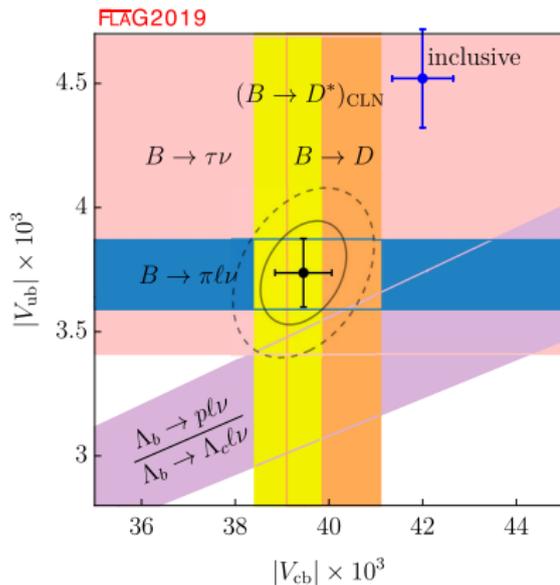

Model dependence in $|V_{cb}|_{\text{excl}}$

Recent analyses indicating CLN may be too restrictive.

1703.06124, 1703.08170, 1708.07134

- 1702.01521 Belle tagged data set, strong model dependence observed CLN/BGL.
- 1903.10002 Babar tagged analysis w/ BGL, model dependence but discrepancy persists.
- 1809.03290, 1905.08209 Belle untagged data set, no strong model dependence, $|V_{cb}|$ discrepancy persists.

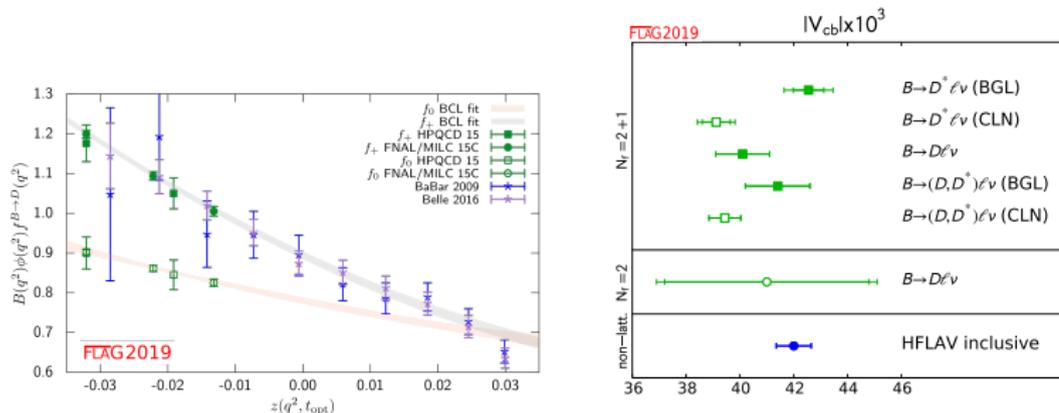

Lattice data for $w > 1$ is extremely useful to help resolve this issue! 1708.07134, 1905.08209

$|V_{cb}|$ and the V_{cb} puzzle

1503.07237 [MILC], 1505.03925 [HPQCD]
 1510.03675 [Belle], 0904.4063[BaBar]

Combining lattice and expt'l data in $B \rightarrow D l \nu$

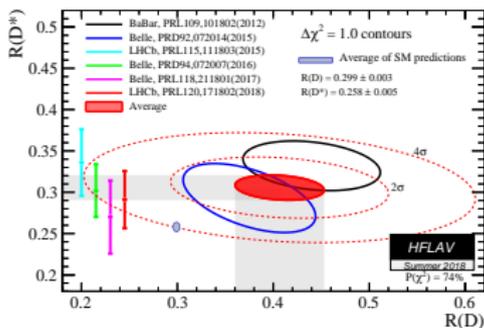

compatible with $B \rightarrow D^*$ extraction and inclusive:
 $|V_{cb}| = 40.49(97)10^{-3} \quad 1606.08030$

R-ratios

R-ratio for $B \rightarrow D^{(*)}$ semileptonic decay defined as

$$R(B \rightarrow D^{(*)}) = \frac{\mathcal{B}(B \rightarrow D^{(*)} \tau \nu)}{\mathcal{B}(B \rightarrow D^{(*)} l \nu)}, \quad l = \mu, e$$

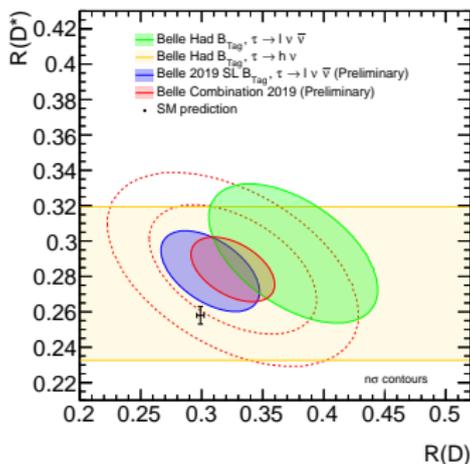

- Test lepton flavour universality.
- Experimentally and theoretically attractive.
 - ▶ Msm't systematics cancel in ratio.
 - ▶ Form factor dependence largely cancels in ratio.
- There are persistent 2-3 σ anomalies in the ratios $R(B \rightarrow D^*)$ and $R(B \rightarrow D)$, as well as recent msm't $R(B_c \rightarrow J/\psi)$ 1711.05623 ($\lesssim 2\sigma$).

- $R(D)_{\text{SM}}$ from lattice calculations.

1503.07237 [FNAL/MILC]

1505.03925 [HPQCD]

- Belle combination moves $R(D^{(*)})$ closer to SM.

- Would be good to have $R(D^*)_{\text{SM}}$ prediction from lattice. \rightarrow all ffs over full kinematic range.

$R(B_c \rightarrow J/\psi)$

- LHCb 1711.05623
 $R(J/\psi) = 0.71(17)_{\text{stat}}(18)_{\text{syst}}$
- w/in 2σ of theory range [0.25, 0.28]
- Preliminary lattice result 0.290(7)

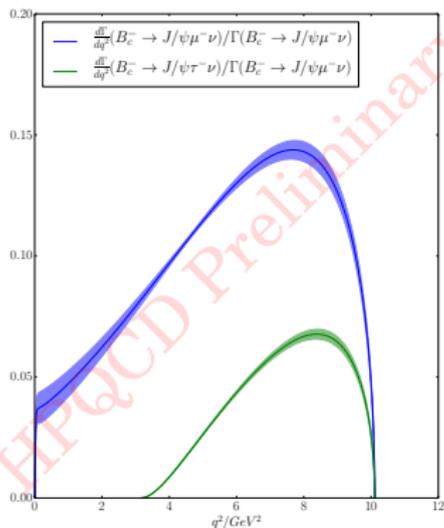

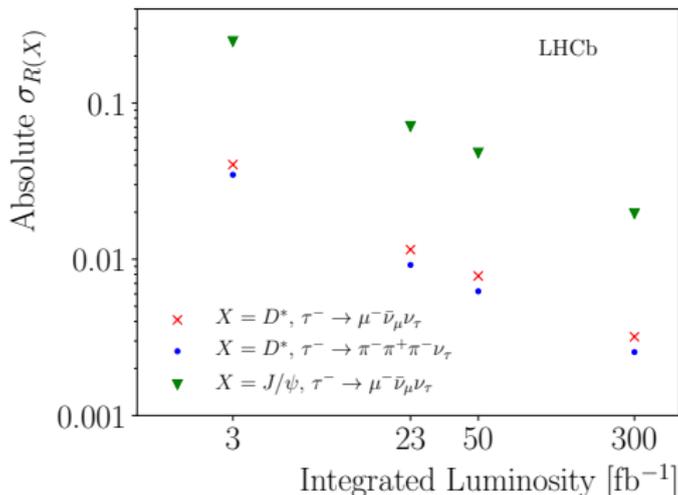

Fig. courtesy J. Harrison

Expect increasingly precise results from large Belle II datasets.
Integrated luminosity:

- $5 \text{ ab}^{-1} \sim 2021$
- $50 \text{ ab}^{-1} \sim 2025$

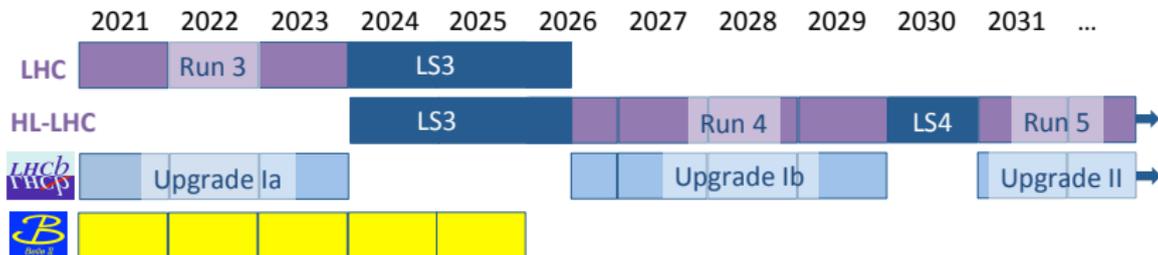

| | Belle (2017) | Belle II | |
|---------------------|-----------------|---------------------|----------------------|
| | | 5 ab^{-1} | 50 ab^{-1} |
| $ V_{cb} $ excl. | 3.3 % | 1.8% | 1.4% |
| $ V_{cb} $ incl. | 1.8% | 1.2% | - |
| $R(D)$ (Had. tag) | 16.5% | 6% | 3 % |
| $R(D^*)$ (Had. tag) | 7.4% | 3% | 2 % |

Increasingly precise $B \rightarrow D^{(*)}$, $B_c \rightarrow J/\psi$.

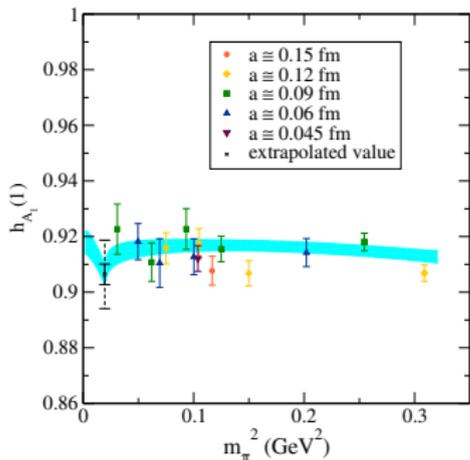

- 23 fb⁻¹ Run 3 (end 2023)
- 50 fb⁻¹ Run 4 (end 2029)
- 300 fb⁻¹ Upgrade II (2030s)

- Increasingly precise $B \rightarrow D^{(*)}$, $B_c \rightarrow J/\psi$.
- $B \rightarrow D^{(*)}$ differential measurements. (Upgrade II)
- Measurements of new modes $B_s \rightarrow D_s^{(*)}$
- $\sigma_{R(D_s^{*})} \sim 6\%$ Run 3, 2.5% Upgrade II.

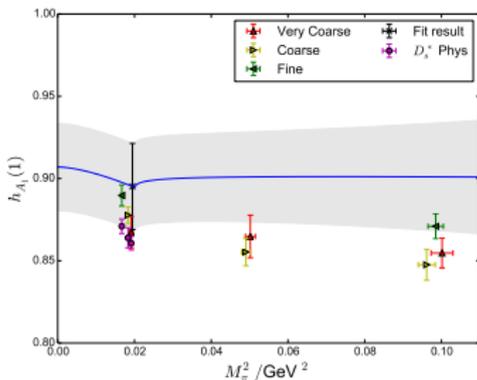

Lattice QCD results

$B \rightarrow D^*$ at zero recoil from LQCD

FNAL/MILC 1403.0635

- $n_f = 2 + 1$ MILC asqtad ensembles
- Clover b with Fermilab interpretation
- $h_{A_1}(1) = 0.906(4)(12)$

HPQCD 1711.11013

- $n_f = 2 + 1 + 1$ MILC HISQ ensembles
- NRQCD b quark
- $h_{A_1}(1) = 0.895(10)(24)$
- $h_{A_1}^s(1) = 0.883(12)(28)$

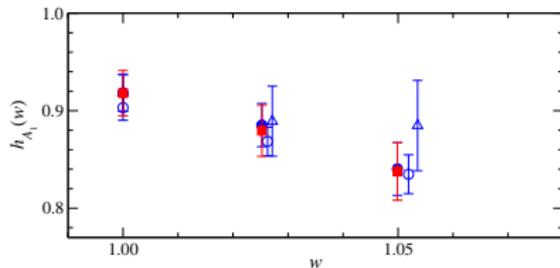

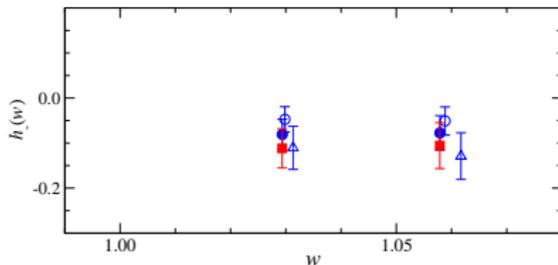

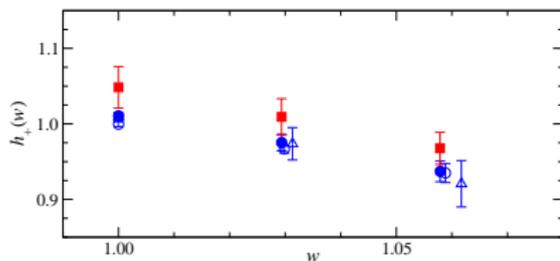

Treatment of heavy quarks

Treatment of c and especially b quarks challenging in lattice simulation due to lattice artifacts which grow as $(am_h)^n$

- Generally one uses an effective theory framework to handle the b quark.
 - ▶ Fermilab interpretation, RHQ, OK, NRQCD
 - ▶ Pros: Solves problem w/ am_h artifacts.
 - ▶ Cons: Requires matching, can still have ap artifacts.
- Also possible to use fully relativistic action provided a is sufficiently small $am_c \ll 1$, $am_b < 1$.
 - ▶ Use improved actions e.g. $\mathcal{O}(a^2) \rightarrow \mathcal{O}(\alpha_s a^2)$
 - ▶ Pros: Absolutely normalised current, straightforward continuum extrap.
 - ▶ Cons: Numerically expensive, extrapolate $m_h \rightarrow m_b$.

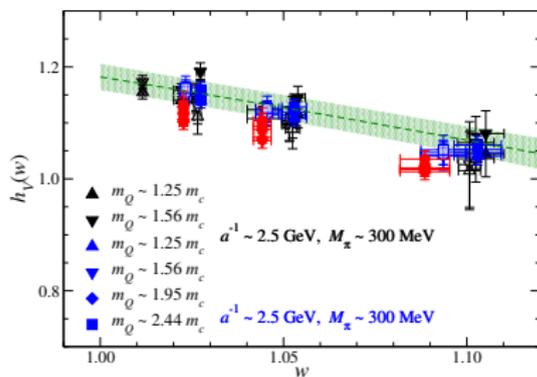

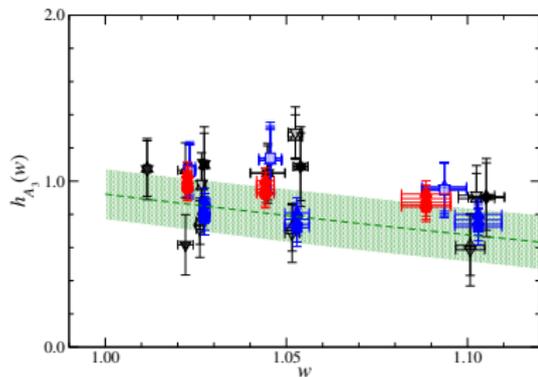

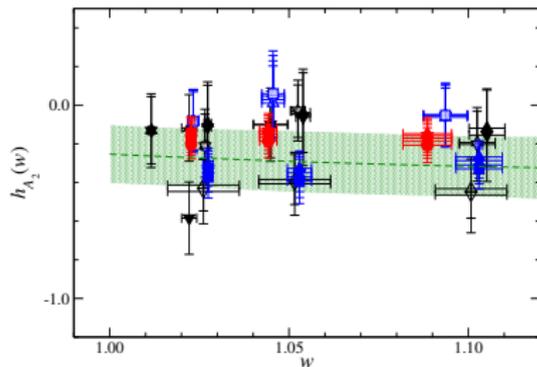

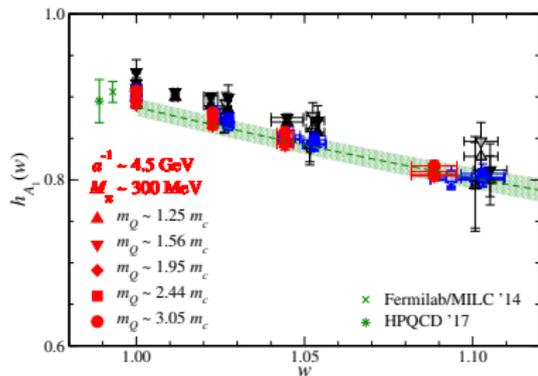

- ‘Relativistic- b ’ approach on Möbius $n_f = 2 + 1$ DWF ensembles.
- $a^{-1} = 2.5, 3.6, (4.5)$ GeV, $M_\pi = 310, (230)$ MeV.
- $am_h < 0.8$ (m_h up to $2.4m_c$)
- Work in range $w \in [1.0, 1.07]$

See talk by Takashi Kaneko, Mon. 15:00 [WD&ME].

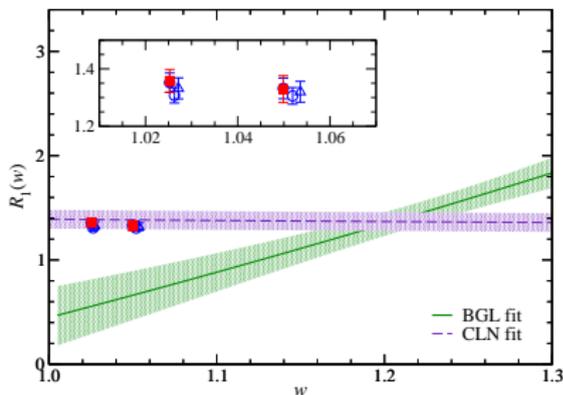

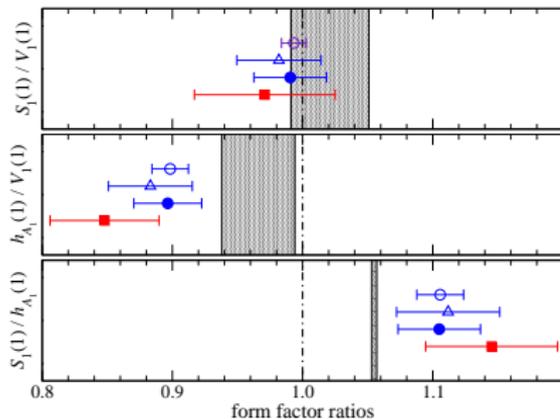

- $a^{-1} \sim 2.5$ GeV, $m_b = 1.25^2 m_c$, $M_\pi \sim 500$ MeV
- △ $a^{-1} \sim 2.5$ GeV, $m_b = 1.25^2 m_c$, $M_\pi \sim 300$ MeV
- $a^{-1} \sim 3.6$ GeV, $m_b = 1.25^2 m_c$, $M_\pi \sim 500$ MeV
- $a^{-1} \sim 3.6$ GeV, $m_b = 1.25^4 m_c$, $M_\pi \sim 500$ MeV

JLQCD $B \rightarrow D^*$

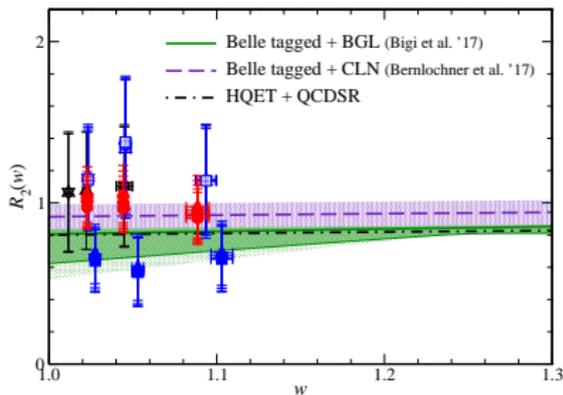

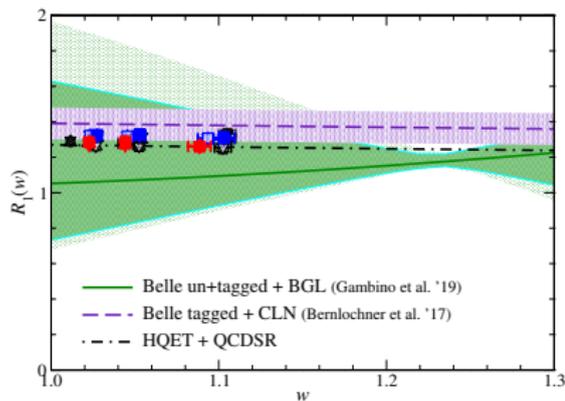

Figs. courtesy Takashi Kaneko.

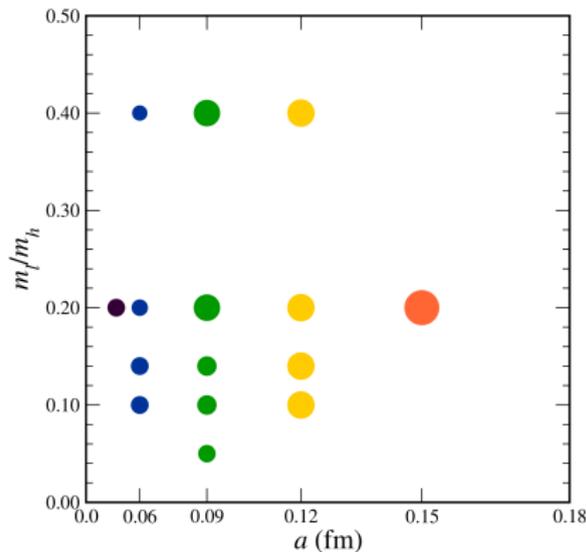

- Indications of significant corrections to NLO HQET.
- On the other hand $R_1(w)$ favors CLN. PRD96 091503

JLQCD $B \rightarrow D^{(*)}$

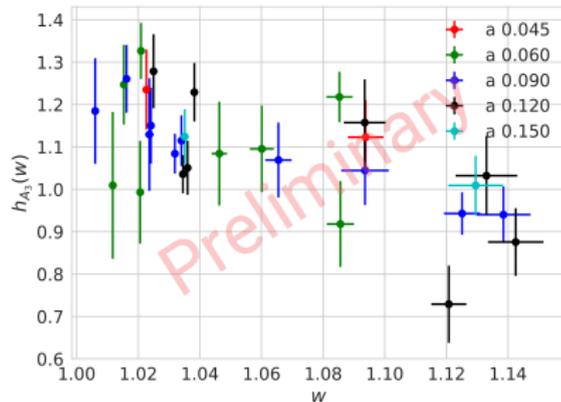

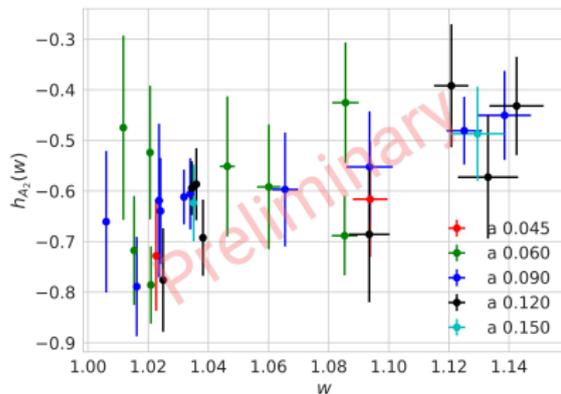

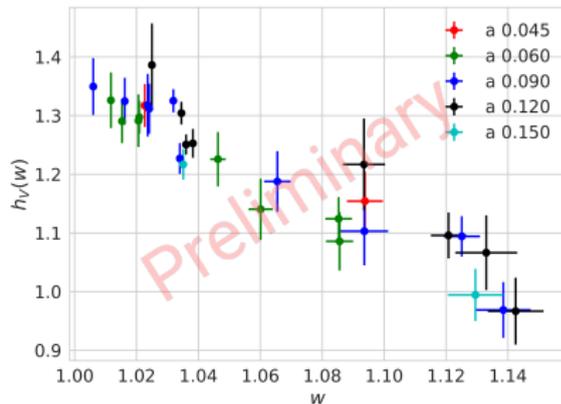

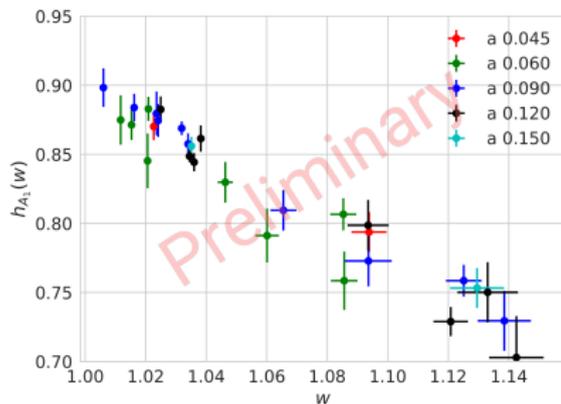

Figs. courtesy Takashi Kaneko.

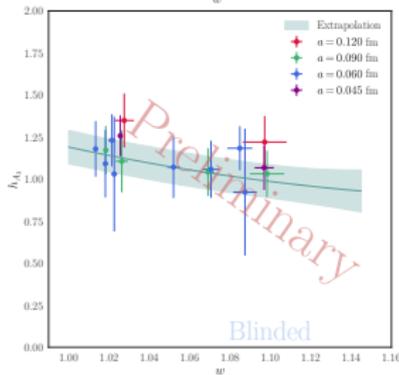

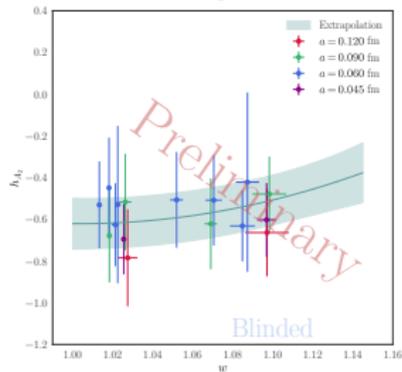

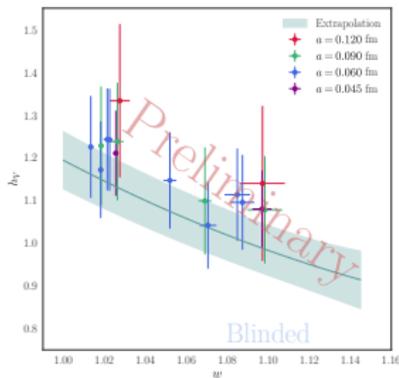

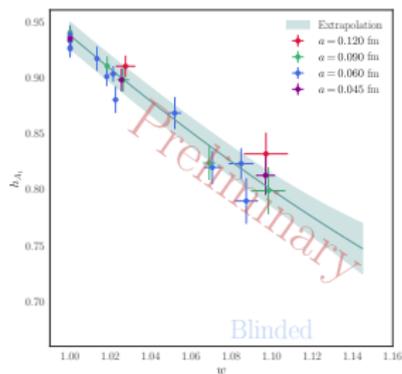

- $n_f = 2 + 1$ asqtad ensembles
- $a^{-1} = 0.15\text{--}0.045$ fm
- Asqtad light quarks
- Clover heavy w/ Fermilab interpretation
- Range $w \in [1.0, 1.15]$

See talk by Alex Vaquero, Mon. 14:40 [WD&ME].

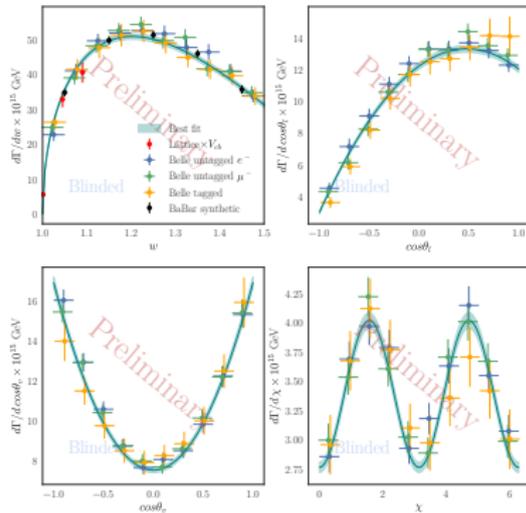

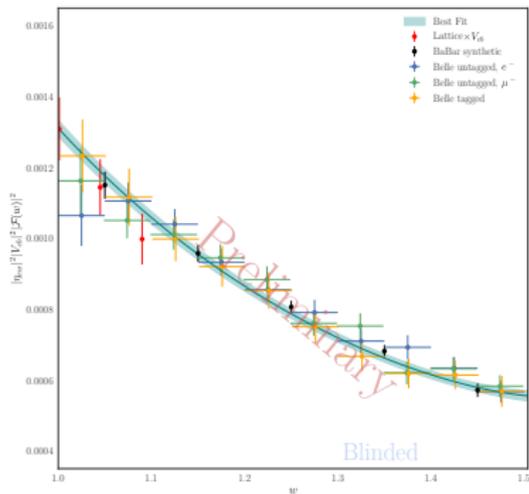

FNAL/MILC $B \rightarrow D^*$

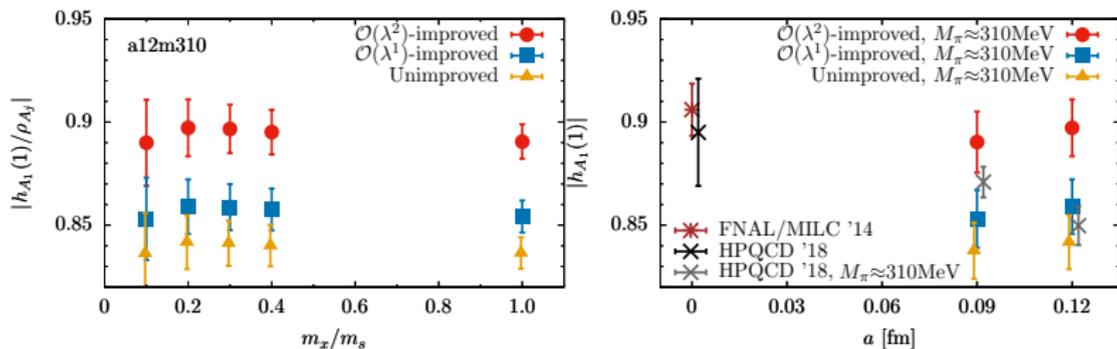

Figs. courtesy A. Vaquero

FNAL/MILC $B \rightarrow D^*$

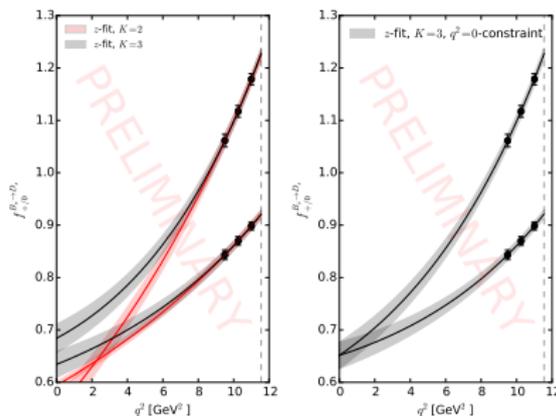

Figs. courtesy A. Vaquero

- $n_f = 2 + 1 + 1$ HISQ MILC lattices.
- Oktay-Kronfeld valence for charm and bottom, reduce discretisation error as compared to Fermilab action.
- Preliminary results at zero recoil. (ρ_{A_1} blind) 1812.07675

See poster by Seungyeob Jwa this evening.

- $n_f = 2 + 1$ DWF ensembles
- Optimized Möbius DWF to simulate charm, $am_q < 0.4$.
- $a^{-1} = 1.79, 2.38, 2.77$ GeV
- b quark RHQ action

 $B_s \rightarrow D_s$

1903.02100

See poster by Oliver Witzel.

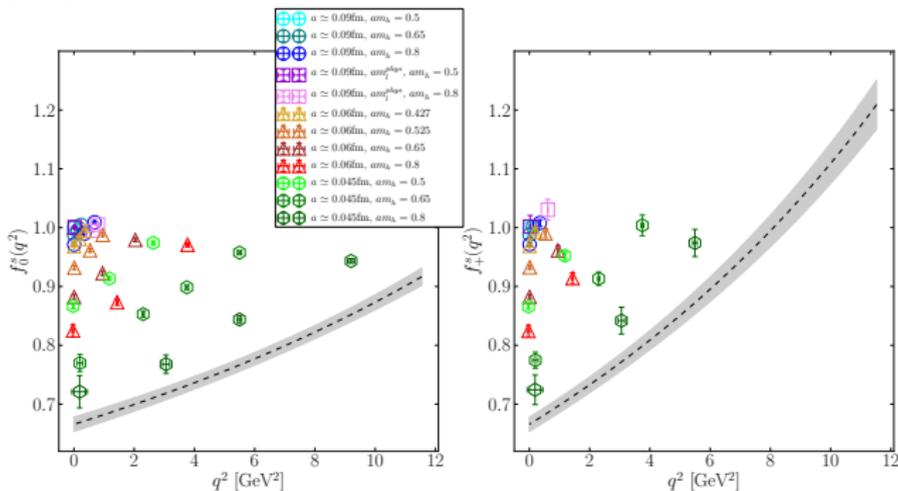

See talk by Felix Erben, Mon. 15:40 [WD&ME].

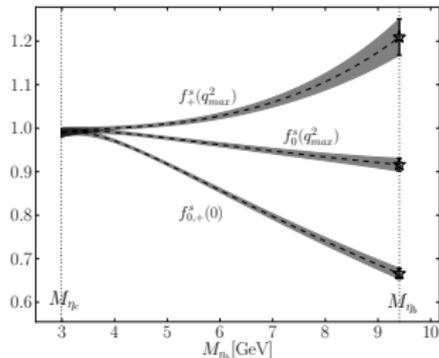

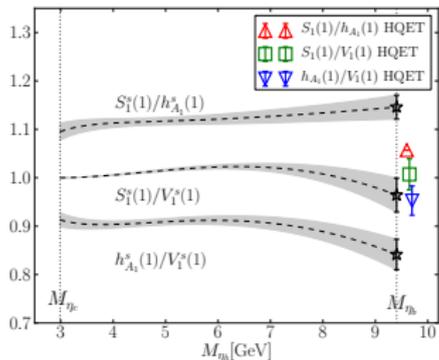

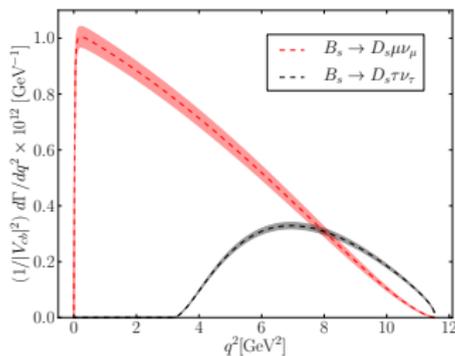

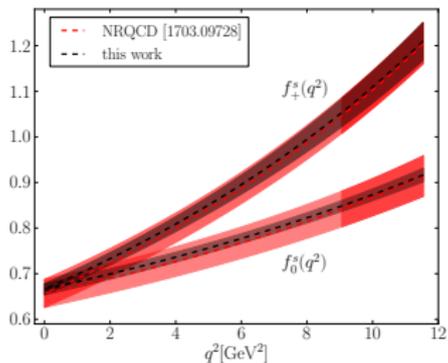

See talk by Ryan Hill, Mon. 16:50 [WD&ME].

HPQCD $B_{(s)} \rightarrow D_{(s)}^{(*)}$

- $n_f = 2 + 1 + 1$ HISQ MILC ensembles, $a^{-1} = 2.19, 3.33, 4.48$ GeV.
- Fully relativistic approach: $am_h < 0.8$ (m_h up to $\sim 0.9 m_b$).
- Work directly over the full kinematic range.

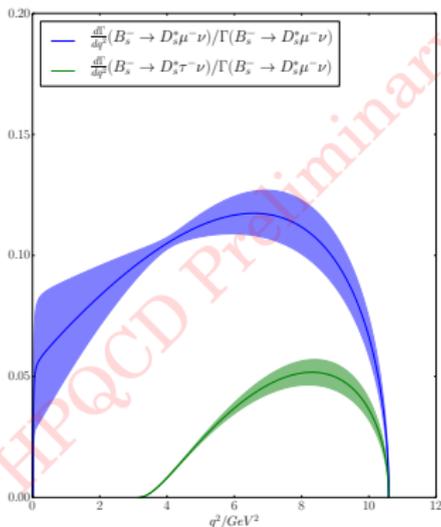

$B_s \rightarrow D_s$ 1906.00701

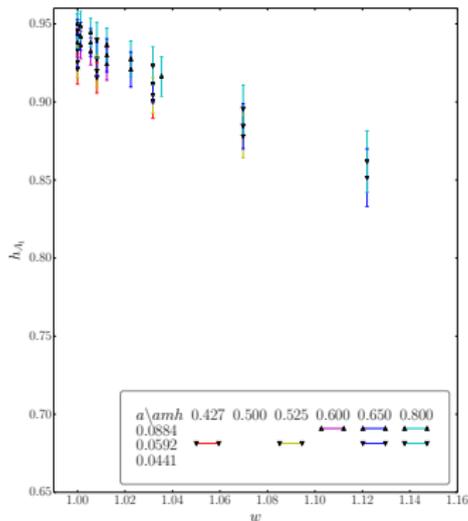

HPQCD $B_{(s)} \rightarrow D_{(s)}^*$

$$B_s \rightarrow D_s^*$$

$$B \rightarrow D^*$$

Figs. courtesy Judd Harrison

Conclusions - I

- Presently several observables in tension with SM: $|V_{cb}|$ incl./excl., $R(D^{(*)})$, $R(J/\psi)$.
- Until now in $B \rightarrow D^*$, only lattice calculations for $h_{A_1}(1)$.
- Reliability of $|V_{cb}|$ using CLN has been called into question – need non-zero recoil form factors to resolve the issue.
- Incl./excl. tension $|V_{cb}|$ from $B \rightarrow D$ reduced when lattice results available away from zero recoil. (Also makes competitive with $B \rightarrow D^*$)

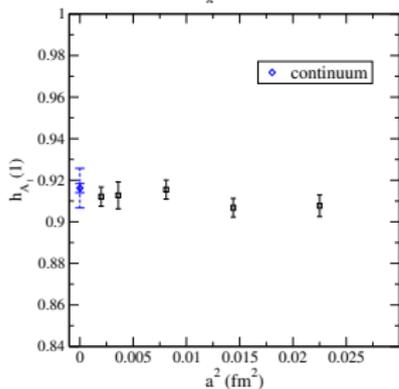

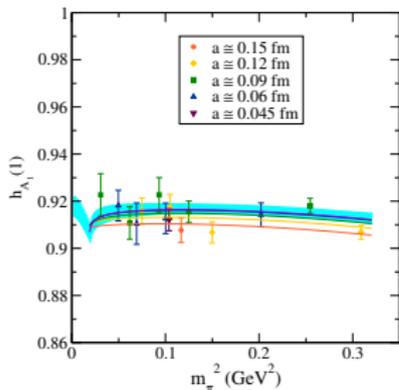

Conclusions - II

- Fortunately, many new calculations are on the horizon. Different strategies, actions, etc.
 - ▶ Effective treatment for b : Fermilab, NRQCD...
 - ▶ ‘Direct’ approach on fine lattices.
- Expect new data of increasing precision from Belle II and LHCb.
- Expect results in new modes: $B_s \rightarrow D_s^{(*)}$, $B_c \rightarrow J/\psi$ both from theory and experiment.

Thank you!

MILC $B \rightarrow D^*$ at zero recoil 1403.0635

$\chi^2/\text{d.o.f.} = 0.73$, p-value = 0.78

| Uncertainty | $h_{A_1}(1)$ |

HPQCD $B_{(s)} \rightarrow D_{(s)}^*$

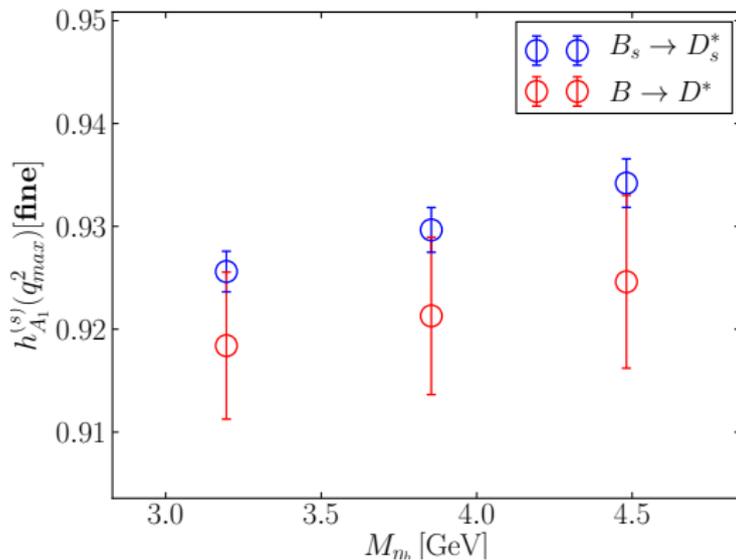

Fig. courtesy Euan McLean

$$aH_{\text{NRQCD}} = aH_0 + a\delta H$$

$$aH_0 = -\frac{\Delta^{(2)}}{2am_b}$$

$$\begin{aligned} a\delta H = & -c_1 \frac{(\Delta^{(2)})^2}{8(am_b)^3} + c_2 \frac{i}{8(am_b)^2} (\nabla \cdot \mathbf{E} - \mathbf{E} \cdot \nabla) \\ & - c_3 \frac{1}{8(am_b)^2} \sigma \cdot (\nabla \times \mathbf{E} - \mathbf{E} \times \nabla) \\ & - c_4 \frac{1}{2am_b} \sigma \cdot \mathbf{B} + c_5 \frac{\Delta^{(4)}}{24am_b} \\ & - c_6 \frac{(\Delta^{(2)})^2}{16n(am_b)^2} \end{aligned}$$

NRQCD currents

f_0 and f_+ are determined in the NRQCD formalism from matrix elements of the vector current $\langle V_\mu^{\text{nrqcd}} \rangle$, where

$$V_0^{\text{nrqcd}} = (1 + \alpha_s z_0^{(0)}) \left[V_0^{(0)} + (1 + \alpha_s z_0^{(1)}) V_0^{(1)} + \alpha_s z_0^{(2)} V_0^{(2)} \right]$$

$$V_k^{\text{nrqcd}} = (1 + \alpha_s z_k^{(0)}) \left[V_k^{(0)} + (1 + \alpha_s z_k^{(1)}) V_k^{(1)} + \alpha_s z_k^{(2)} V_k^{(2)} + \alpha_s z_k^{(3)} V_k^{(3)} + \alpha_s z_k^{(4)} V_k^{(4)} \right].$$

Form factor extrapolation

Experimental data traditionally analyzed in HQET framework:

Fit form factors as function of w to extract $\mathcal{F}(1)\eta_{EW}|V_{cb}|$,

compare with $h_{A_1}(1)$ from lattice to extract $|V_{cb}|$.

Caprini-Lellouch-Neubert (CLN) parameterization:

$$h_{A_1}(z) = h_{A_1}(1)(1 - 8\rho^2 z + (53\rho^2 - 15)z^2 - (231\rho^2 - 91)z^3)$$

$$R_1(w) = \frac{h_V(w)}{h_{A_1}(w)} = R_1(1) - 0.12(w - 1) + 0.05(w - 1)^2$$

$$R_2(w) = \frac{r h_{A_2}(w) + h_{A_3}(w)}{h_{A_1}(w)} = R_2(1) - 0.11(w - 1) - 0.06(w - 1)^2$$

(Boyd-Grinstein-Lebed) BGL parameterization uses only weak unitarity constraints: In terms of

$z = (\sqrt{w + 1} - \sqrt{2})/(\sqrt{w + 1} + \sqrt{2})$, $z \in [0, 0.056]$:

$$f_i(z) = \frac{1}{P_i(z)\phi_i(z)} \sum_{k=0}^{n_i} a_k^i z^k$$
