the Standard Model / SO(10) chiral gauge theory

SU(3)xSU(2)xU(1) xU(1)_{B-L}

$$\begin{array}{ll} (\underline{3}, \underline{2})_{1/6} & (\underline{1}, \underline{2})_{-1/2} \\ (\underline{3}^*, \underline{1})_{-2/3} & (\underline{3}^*, \underline{1})_{1/3} \quad (\underline{1}, \underline{1})_1 \quad (\underline{1}, \underline{1})_0 \end{array}$$

SO(10)

16

- Complex, but free from gauge anomalies, both local and global ones

$$\text{Tr}\{P_+ \sum_{a_1 b_1} [\sum_{a_2 b_2} \sum_{a_3 b_3} + \sum_{a_3 b_3} \sum_{a_2 b_2}]\} = 0$$

$$\Sigma_{ab} = -\frac{i}{4} [\Gamma^a, \Gamma^b] \quad \{\Gamma^a \mid a = 1, 2, \dots, 10\}$$

$$P_+ = \frac{1 + \Gamma^{11}}{2}, \quad \Gamma^{11} = -i\Gamma^1\Gamma^2 \dots \Gamma^{10}$$

$$\Omega^{\text{Spin}_5(\text{BSpin}(10))} = 0$$

$$\Omega_5(\text{Spin}(5) \times \text{Spin}(10) / \mathbb{Z}_2) = \mathbb{Z}_2$$

[Garcia-Etxebarria-Montero, Wang-Wen-Witten (2018)]

- U(1) fermion symmetry broken by chiral anomaly
=> zero modes (4 x m / SU(2) instanton)
=> <0| 't Hooft vertex |0>
- 't Hooft vertex for 16 : 16 x 16 x 16 x 16 => 1

(16 x 16 => 10)

$$T_-(x) = \frac{1}{2} V_-^a(x) V_-^a(x) \quad V_-^a(x) = \psi_-(x)^T i\gamma_5 C_D T^a \psi_-(x)$$

$$\bar{T}_-(x) = \frac{1}{2} \bar{V}_-^a(x) \bar{V}_-^a(x) \quad \bar{V}_-^a(x) = \bar{\psi}_-(x) i\gamma_5 C_D T^{a\dagger} \bar{\psi}_-(x)^T$$

$$T^a = C\Gamma^a \quad T^{aT} = T^a$$

Overlap Weyl fermions

[Narayanan-Neuberger] [Luscher]

$$S_w = a^4 \sum_x \bar{\psi}_-(x) D \psi_-(x)$$

$$\psi_-(x) = \hat{P}_- \psi(x) \quad \bar{\psi}_-(x) = \bar{\psi}(x) P_+$$

$$D = \frac{1}{2a} \left(1 + X \frac{1}{\sqrt{X^\dagger X}} \right), \quad X = aD_w - m_0$$

$$\gamma_5 D + D \gamma_5 = 2a D \gamma_5 D$$

$$\hat{\gamma}_5 = \gamma_5 (1 - 2aD) \quad \hat{\gamma}_5^2 = \mathbb{I}$$

$$\hat{P}_\pm = \left(\frac{1 \pm \hat{\gamma}_5}{2} \right), \quad P_\pm = \left(\frac{1 \pm \gamma_5}{2} \right)$$

Path Integral measure

$$e^{\Gamma_w[U]} \equiv \int \mathcal{D}[\psi_-] \mathcal{D}[\bar{\psi}_-] e^{-S_w[\psi_-, \bar{\psi}_-]}$$

$$\mathcal{D}_\star[\psi_-] \mathcal{D}_\star[\bar{\psi}_-] \equiv \prod_j dc_j \prod_k d\bar{c}_k$$

$$\psi_-(x) = \sum_j v_j(x) c_j, \quad \bar{\psi}_-(x) = \sum_k \bar{c}_k \bar{v}_k(x)$$

$$v_j(x) \rightarrow \tilde{v}_j(x) = v_l(x) Q_{lj}^{-1}[U]$$

$$\prod_j dc_j \rightarrow \prod_j d\tilde{c}_j = \prod_j dc_j \times \det Q[U]$$

$$e^{\Gamma_w[U]} = \det(\bar{v} D v)$$

$$(\bar{v} D v)_{ki} \quad (k = 1, \dots, n/2; i = 1, \dots, n/2 + 8Q)$$

(matrix shape is variable, can be rectangular)

Neuberger & Narayanan showed the chiral determinant as vacuum overlap reproduces zero-modes and VEV of 't Hooft vertex.

Luscher formulated a method to reconstruct the chiral basis preserving locality, lattice symmetries and exact gauge-invariance. successful for the $U(1)$, $SU(2)_L \times U(1)_Y$ cases, but not yet for non-Abelian cases.

Overlap Weyl fermions in 16 of **SO(10)** cf. [Neuberger-Narayanan] [Luscher]

$$S_w = a^4 \sum_x \bar{\psi}_-(x) D \psi_-(x)$$

$$\psi_-(x) = \hat{P}_- \psi(x) \quad \bar{\psi}_-(x) = \bar{\psi}(x) P_+$$

$$\psi_+(x) = \hat{P}_+ \psi(x) \quad \bar{\psi}_+(x) = \bar{\psi}(x) P_-$$

$$D = \frac{1}{2a} \left(1 + X \frac{1}{\sqrt{X^\dagger X}} \right), \quad X = aD_w - m_0$$

$$\gamma_5 D + D \gamma_5 = 2a D \gamma_5 D$$

$$\hat{\gamma}_5 = \gamma_5 (1 - 2aD) \quad \hat{\gamma}_5^2 = \mathbb{I}$$

$$\hat{P}_\pm = \left(\frac{1 \pm \hat{\gamma}_5}{2} \right), \quad P_\pm = \left(\frac{1 \pm \gamma_5}{2} \right)$$

Path Integral measure for the 16

$$e^{\Gamma_w[U]} \equiv \int \mathcal{D}[\psi_-] \mathcal{D}[\bar{\psi}_-] e^{-S_w[\psi_-, \bar{\psi}_-]}$$

$$\mathcal{D}[\psi_-] \mathcal{D}[\bar{\psi}_-] \equiv \mathcal{D}[\psi] \mathcal{D}[\bar{\psi}] \prod_x F[T_+(x)] \prod_x F[\bar{T}_+(x)]$$

$$\mathcal{D}[\psi] \mathcal{D}[\bar{\psi}] \equiv \prod_{x \in \Lambda} \prod_{\alpha=1}^4 \prod_{s=1}^{16} d\psi_{\alpha s}(x) \prod_{x \in \Lambda} \prod_{\alpha=1}^4 \prod_{s=1}^{16} d\bar{\psi}_{\alpha s}(x)$$

$$T_+(x) = \frac{1}{2} V_+^a(x) V_+^a(x), \quad V_+^a(x) = \psi_+(x)^T i\gamma_5 C_D T^a \psi_+(x)$$

$$\bar{T}_+(x) = \frac{1}{2} \bar{V}_+^a(x) \bar{V}_+^a(x), \quad \bar{V}_+^a(x) = \bar{\psi}_+(x) i\gamma_5 C_D T^a \bar{\psi}_+(x)^T$$

$$F(w) \equiv 4! (z/2)^{-4} I_4(z) \Big|_{(z/2)^2=w}$$

$$F(w) \Big|_{w=(1/2)u^a u^a} = (\pi^5/12)^{-1} \int \prod_{a=1}^{10} de^a \delta(\sqrt{e^b e^b} - 1) e^{e^c u^c}$$

Right-handed part of the Dirac measure is “saturated” completely by “Right-handed” ’t Hooft vertexes .

The measure correctly reproduces zero-modes and VEV of ’t Hooft vertex

Exact gauge inv. is manifest and CP inv. can be proved.

16 x 3 (three families)

SO(10) \rightarrow SU(3)xSU(2)xU(1)

Higgs scalar **(1,2)_{1/2}** & Yukawa int.

$$S_Y = \sum_x \left[y_u \bar{q}_-^i(x) \tilde{\phi}(x) u_+^i(x) + y_u^* \bar{u}_+^i(x) \tilde{\phi}(x)^\dagger q_-^i(x) \right. \\ \left. + y_d \bar{q}_-^i(x) \phi(x) d_+^i(x) + y_d^* \bar{d}_+^i(x) \phi(x)^\dagger q_-^i(x) \right. \\ \left. + y_l \bar{l}_-(x) \phi(x) e_+(x) + y_l^* \bar{e}_+(x) \phi(x)^\dagger l_-(x) \right]$$

Exact gauge inv. is manifest and CP violations comes from KM, PMNS matrixes and theta terms.

cf. [Ishibashi-Fujikawa-Suzuki(2002)]

Summary and Discussions

- We defined path integral measure for overlap Weyl fermions in 16 of SO(10) / the SM
- manifestly gauge-invariant by using full Dirac-field measure, but saturating the right-handed part with 't Hooft vertices completely !
- covers all possible topological sectors
- reproduces zero modes, 't Hooft vertex VEV, fermion number non-conservation
- CP invariant $\Gamma_W[U^{\text{CP}}] = \Gamma_W[U]$
- Locality : $-i\mathcal{I}_\eta$ should be a local functional of link field, Testable, Need a rigorous proof

$$\begin{aligned}
 -i\mathcal{I}_\eta &\equiv -2 \text{Tr} \{ \delta_\eta \hat{P}_+ \langle \psi_+ [\psi_+^T i\gamma_5 C_D T^a E^a] \rangle_F / \langle 1 \rangle_F \} \\
 &= \langle \text{Tr} \{ (u^T i\gamma_5 C_D T^a E^a \delta_\eta \hat{P}_+ u) (u^T i\gamma_5 C_D T^a E^a u)^{-1} \} \rangle_E / \langle 1 \rangle_E
 \end{aligned}$$

$$\|\langle \psi_+(x) [\psi_+^T i\gamma_5 C_D T^a E^a(y)] \rangle_F / \langle 1 \rangle_F\| \leq C |x-y|^\sigma e^{-|x-y|/\xi}$$

the similar bounds for the variations w.r.t. the link field

In weak gauge-coupling limit, MC studies feasible without sign problem, **Checked in 2D**

- Making the 't Hooft vertex terms **well-defined in large coupling limit**,
Established the relations with **GW Mirror-fermion model** [Poppitz et al (2006)]
DW fermion with boundary EP terms [Creutz et al (1997)]
4D TI/TSC with Gapped boundary phase

cf. $\hat{P}_+^T i\gamma_5 C_D P_+ T^a E^a(x) \hat{P}_+ = (1 - D)^T i\gamma_5 C_D P_+ T^a E^a(x) (1 - D)$

Discussions

Relation to the reconstruction approach by Luscher

$$e^{\Gamma_W[U]} = \det(\bar{v}Dv) \times \int \mathcal{D}[E] \text{pf}(u^T i\gamma_5 C_D T^a E^a u) \quad \langle \mathcal{O} \rangle_E \equiv \int \mathcal{D}[E] \text{pf}(u^T i\gamma_5 C_D T^a E^a u) \mathcal{O}$$

Link-field dependence of Effective action

$$\delta_\eta \Gamma_W[U] = \text{Tr}\{P_+ \delta_\eta D D^{-1}\} - i\mathfrak{L}_\eta \quad (\delta_\eta U_\mu(x) = i\eta_\mu(x)U_\mu(x)) \quad \sum_j (u_j, \delta_\eta u_j) + \sum_j (v_j, \delta_\eta v_j) = 0$$

$$-i\mathfrak{L}_\eta = \langle \text{Tr}\{(u^T i\gamma_5 C_D T^a E^a \delta_\eta \hat{P}_+ u)(u^T i\gamma_5 C_D T^a E^a u)^{-1}\} \rangle_E / \langle 1 \rangle_E$$

cf. measure term
(local counter terms)

$$-i\mathfrak{L}_\eta = \sum_j (v_j, \delta_\eta v_j) \quad [\text{Luscher (1999, 2000)}]$$

- 1) gauge-covariant current, smooth and local w.r.t. link field
- 2) anomalous conservation law
- 3) integrability conditions (local and global ones)

- $\langle 1 \rangle_E$ is non-vanishing over the space of admissible link fields
- $-i\mathfrak{L}_\eta$ is smooth and local with respect to gauge link field

$$\mathfrak{L}_\eta = \text{Re}\{\mathfrak{L}_\eta\}$$

If these conditions are fulfilled, one can reconstruct the chiral basis preserving locality, lattice symmetries and exact gauge-invariance, following the method by Luscher

Relation to the other approaches

Overlap Weyl fermions in 16 of $SO(10)$

$$e^{\Gamma_w[U]} \equiv \int \mathcal{D}[\psi] \mathcal{D}[\bar{\psi}] \prod_x F[T_+(x)] \prod_x F[\bar{T}_+(x)] e^{-S_w[\psi_-, \bar{\psi}_-]}$$

- Eichten-Preskill model (species doublers)
—> realized by the Overalp Fermions/GW rel.
- Mirror Fermion model (mirror modes)
using the Overalp Fermions/GW rel.
—> non-singular and well-defined large limit of
Majorana-Yukawa coupling in PMS phase
- 4+1 dim. DWF w/ boundary Eichten-Preskill term
- 4dim. TI/TSC w/ gapped boundary phase
(Hamiltonian formalism of 4+1 dim. DWF)
[Creutz, Horvath(1994)] [Qi, Hughes, Zhang (2008)]
—> Low energy effective 4d lattice model
through non-singular boundary terms
- Recent studies on PMS/“Mass without Symmetry Breaking”
—> $O(10)$ spin model defined with 't Hooft vertex pfaffian
