

Dynamical description of partonic phase at finite chemical potential

Elena Bratkovskaya

(GSI Darmstadt & Uni. Frankfurt)

**Pierre Moreau, Olga Soloveva, Lucia Oliva,
Taesoo Song, Wolfgang Cassing**

*Theory of hot matter and relativistic heavy-ion collisions,
THOR Annual Meeting,
2-6 September 2019, Istanbul, Turkey*

The ,holy grail' of heavy-ion physics:

The phase diagram of QCD

- Study of the **phase transition** from hadronic to partonic matter – **Quark-Gluon-Plasma**

- Search for the **critical point**
- Search for signatures of **chiral symmetry restoration**

- Study of the **in-medium** properties of hadrons at high baryon density and temperature

Theory: lattice QCD data for $\mu_B = 0$ and finite $\mu_B > 0$

□ Deconfinement phase transition from hadron gas to QGP
with increasing T and μ_B

IQCD: J. Guenther et al., Nucl. Phys. A 967 (2017) 720

➔ Lattice QCD results: up to $\mu_B < 400 \text{ MeV}$:
Crossover: hadron gas \rightarrow QGP

Degrees-of-freedom of QGP

❖ IQCD gives QGP EoS at finite μ_B

! need to be interpreted in terms of degrees-of-freedom

pQCD:

- ☐ weakly interacting system
- ☐ massless quarks and gluons

Non-perturbative QCD ← pQCD

Thermal QCD

= QCD at high parton densities:

- ☐ strongly interacting system
- ☐ massive quarks and gluons
- ➔ quasiparticles
- = effective degrees-of-freedom

❖ How to learn about degrees-of-freedom of QGP ? ➔ HIC experiments

DQPM (T, μ_q)

finite μ_q

Dynamical QuasiParticle Model (DQPM)

DQPM describes **QCD** properties in terms of **,resummed' single-particle Green's functions** (propagators G^R) – in the sense of a two-particle irreducible (2PI) approach:

- Degrees-of-freedom: **interacting quasiparticles - quarks and gluons** with Lorentzian spectral functions:

$$\rho_j(\omega, \mathbf{p}) = \frac{\gamma_j}{\tilde{E}_j} \left(\frac{1}{(\omega - \tilde{E}_j)^2 + \gamma_j^2} - \frac{1}{(\omega + \tilde{E}_j)^2 + \gamma_j^2} \right)$$

$$\equiv \frac{4\omega\gamma_j}{(\omega^2 - \mathbf{p}^2 - M_j^2)^2 + 4\gamma_j^2\omega^2}$$

$$\rho = -2 \text{Im } G^R$$

$$\tilde{E}_j^2(\mathbf{p}) = \mathbf{p}^2 + M_j^2 - \gamma_j^2$$

- Resummed properties of the quasiparticles are specified by scalar **complex self-energies**:

gluon propagator: $\Delta^{-1} = P^2 - \Pi$	&	quark propagator $S_q^{-1} = P^2 - \Sigma_q$
gluon self-energy: $\Pi = M_g^2 - i2g_g\omega$	&	quark self-energy: $\Sigma_q = M_q^2 - i2g_q\omega$

- Real part of the self-energy: **thermal mass** (M_g, M_q)
- Imaginary part of the self-energy: **interaction width** of partons (γ_g, γ_q)

Parton properties

- Modeling of the quark/gluon **masses** and **widths** (inspired by HTL calculations)

Masses:

$$M_{q(\bar{q})}^2(T, \mu_B) = \frac{N_c^2 - 1}{8N_c} g^2(T, \mu_B) \left(T^2 + \frac{\mu_q^2}{\pi^2} \right)$$

$$M_g^2(T, \mu_B) = \frac{g^2(T, \mu_B)}{6} \left(\left(N_c + \frac{1}{2} N_f \right) T^2 + \frac{N_c}{2} \sum_q \frac{\mu_q^2}{\pi^2} \right)$$

Widths:

$$\gamma_{q(\bar{q})}(T, \mu_B) = \frac{1}{3} \frac{N_c^2 - 1}{2N_c} \frac{g^2(T, \mu_B) T}{8\pi} \ln \left(\frac{2c}{g^2(T, \mu_B)} + 1 \right)$$

$$\gamma_g(T, \mu_B) = \frac{1}{3} N_c \frac{g^2(T, \mu_B) T}{8\pi} \ln \left(\frac{2c}{g^2(T, \mu_B)} + 1 \right)$$

➔ **DQPM :**

only **one parameter** ($c = 14.4$)
+ (T, μ_B) - dependent **coupling constant** have to be determined from lattice results

- **Coupling constant:** input: IQCD **entropy density** as a function of temperature for μ_B

➔ Fit to lattice data at $\mu_B=0$ with

$$g^2(s/s_{SB}) = d \left((s/s_{SB})^e - 1 \right)^f$$

$$s_{SB}^{QCD} = 19/9 \pi^2 T^3$$

DQPM at finite (T, μ_q) : scaling hypothesis

- Scaling hypothesis for the effective temperature T^* for $N_f = N_c = 3$

$$\mu_u = \mu_d = \mu_s = \mu_q$$

$$T^{*2} = T^2 + \frac{\mu_q^2}{\pi^2}$$

- Coupling constant:

$$g(T/T_c(\mu=0)) \longrightarrow g(T^*/T_c(\mu))$$

- Critical temperature $T_c(\mu_q)$: obtained by requiring a constant energy density ε for the system at $T=T_c(\mu_q)$ where ε at $T_c(\mu_q=0)=156$ GeV is fixed by IQCD at $\mu_q=0$

$$\frac{T_c(\mu_q)}{T_c(\mu_q=0)} = \sqrt{1 - \alpha \mu_q^2} \approx 1 - \alpha/2 \mu_q^2 + \dots$$

! Consistent with lattice QCD:

IQCD: C. Bonati et al., PRC90 (2014) 114025

$$\frac{T_c(\mu_B)}{T_c} = 1 - \kappa \left(\frac{\mu_B}{T_c} \right)^2 + \dots$$

$$\text{IQCD } \kappa = 0.013(2) \longleftrightarrow \kappa_{DQPM} \approx 0.0122$$

$$\alpha \approx 8.79 \text{ GeV}^{-2}$$

DQPM: parton properties

- Coupling constant as a function of (T, μ_B)
- Masses and widths as a function of (T, μ_B)

→ Lorentzian spectral function:

DQPM Thermodynamics

□ Entropy and baryon density in the quasiparticle limit (G. Baym 1998):

$$s^{dqp} = - \int \frac{d\omega}{2\pi} \frac{d^3p}{(2\pi)^3} \left[d_q \frac{\partial n_B}{\partial T} (\text{Im}(\ln -\Delta^{-1}) + \text{Im} \Pi \text{Re} \Delta) \right. \\ + \sum_{q=u,d,s} d_q \frac{\partial n_F(\omega - \mu_q)}{\partial T} (\text{Im}(\ln -\underline{S_q^{-1}}) + \text{Im} \underline{\Sigma_q} \text{Re} \underline{S_q}) \\ \left. + \sum_{\bar{q}=\bar{u},\bar{d},\bar{s}} d_{\bar{q}} \frac{\partial n_F(\omega + \mu_q)}{\partial T} (\text{Im}(\ln -\underline{S_{\bar{q}}^{-1}}) + \text{Im} \underline{\Sigma_{\bar{q}}} \text{Re} \underline{S_{\bar{q}}}) \right]$$

$$n^{dqp} = - \int \frac{d\omega}{2\pi} \frac{d^3p}{(2\pi)^3} \left[\sum_{q=u,d,s} d_q \frac{\partial n_F(\omega - \mu_q)}{\partial \mu_q} (\text{Im}(\ln -\underline{S_q^{-1}}) + \text{Im} \underline{\Sigma_q} \text{Re} \underline{S_q}) \right. \\ \left. + \sum_{\bar{q}=\bar{u},\bar{d},\bar{s}} d_{\bar{q}} \frac{\partial n_F(\omega + \mu_q)}{\partial \mu_q} (\text{Im}(\ln -\underline{S_{\bar{q}}^{-1}}) + \text{Im} \underline{\Sigma_{\bar{q}}} \text{Re} \underline{S_{\bar{q}}}) \right]$$

Blaziot, Iancu, Rebhan, Phys. Rev. D 63 (2001) 065003

DQPM: — P/T^4 — ε/T^4 — s/T^3 — I/T^4

QCD at finite (T, μ_B)

Taylor series of thermodynamic quantities in terms of (μ_B/T)

□ For the pressure:

$$\frac{P(T, \mu_B)}{T^4} = \sum_{n=0} \frac{1}{n!} \chi_B^n \left(\frac{\mu_B}{T} \right)^n$$

with the **baryon number susceptibilities** defined as:

$$\chi_B^n = \left. \frac{\partial^n P}{\partial \mu_B^n} \right|_{\mu_B=0}$$

□ **Recent IQCD results - with the 6th order susceptibility**

$$\frac{P}{T^4} = c_0(T) + c_2(T) \left(\frac{\mu_B}{T} \right)^2 + c_4(T) \left(\frac{\mu_B}{T} \right)^4 + c_6(T) \left(\frac{\mu_B}{T} \right)^6 + \mathcal{O}(\mu_B^8)$$

WB IQCD: J. Günther, R. Bellwied, S. Borsanyi, Z. Fodor, S. D. Katz, A. Pasztor, C. Ratti, EPJ Web Conf. 137, 07008 (2017) 158

DQPM: Isentropic trajectories for (T, μ_B)

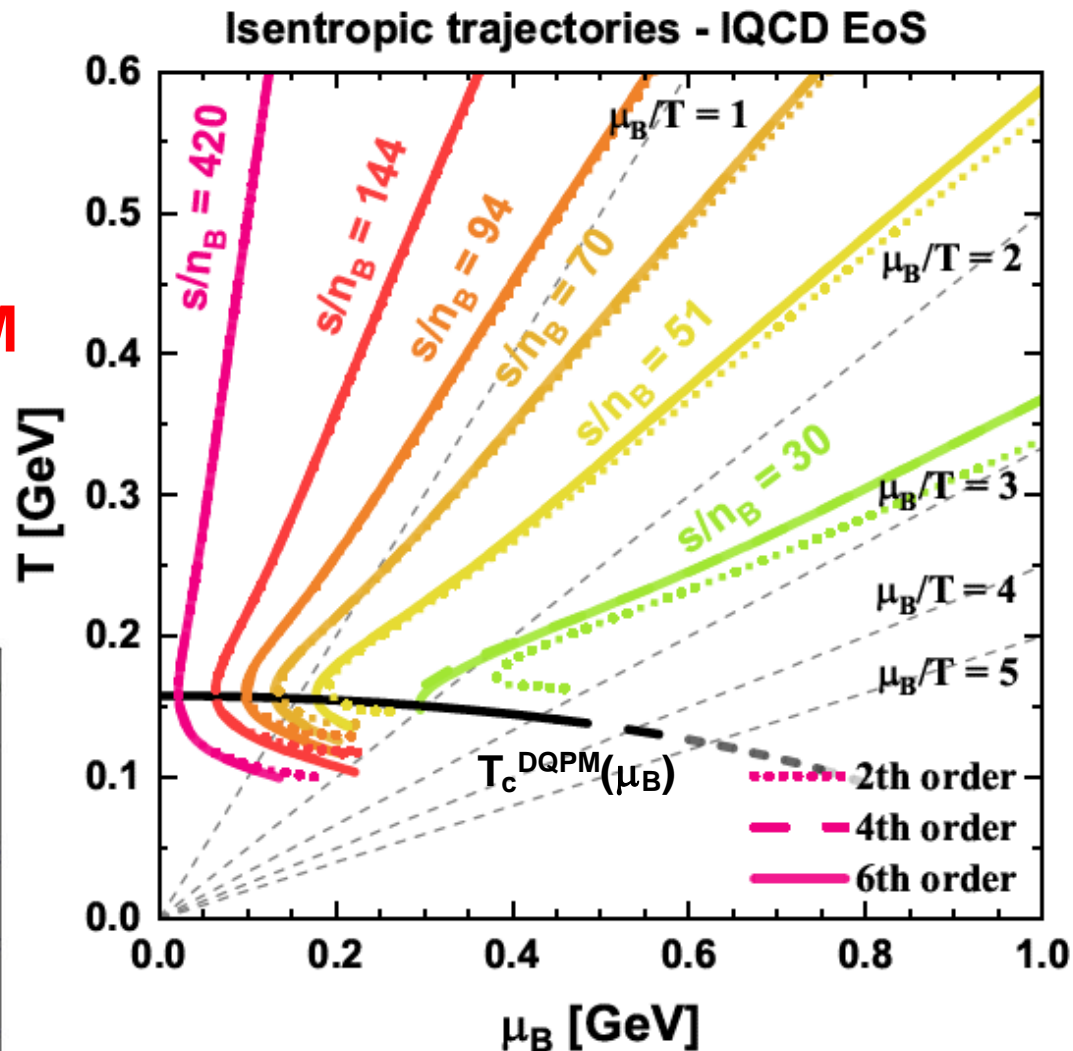

- Correspondance $s/n_B \leftrightarrow$ collisional energy

$$\begin{aligned}
 s/n_B &= 420 \leftrightarrow 200 \text{ GeV} \\
 &= 144 \leftrightarrow 62.4 \text{ GeV} \\
 &= 94 \leftrightarrow 39 \text{ GeV} \\
 &= 70 \leftrightarrow 27 \text{ GeV} \\
 &= 51 \leftrightarrow 19.6 \text{ GeV} \\
 &= 30 \leftrightarrow 14.5 \text{ GeV}
 \end{aligned}$$

DQPM

- Safe for $(\mu_B/T) < 2$

QGP in DQPM: partonic interactions

Partonic interactions

Reminder (2013): DQPM(T) in PHSD 4.0

DQPM provides the **total width** Γ of the dynamical quasiparticles

$$\Gamma_{total} = \Gamma_{elastic} + \Gamma_{inelastic}$$

V. Ozvenchuk et al.,
PRC 87 (2013) 024901,
PRC 87 (2013) 064903

- obtain the **partial widths** (i.e. cross sections) for different channels from the PHSD simulations in the box:
transition rates \leftrightarrow DQPM width

- **(quasi-) elastic collisions:**

$$\rightarrow \sigma_i(\varepsilon)$$

- **inelastic collisions:**

$$\sigma_{q\bar{q} \rightarrow g}(s, \varepsilon, M_q, M_{\bar{q}}) = \frac{2}{4} \frac{4\pi s \Gamma_g^2(\varepsilon)}{[s - M_g^2(\varepsilon)]^2 + s \Gamma_g^2(\varepsilon)} \frac{1}{P_{rel}^2}$$

2016-2019

To improve the description of QGP dynamics in PHSD we need:
off-shell differential and total cross sections $\sigma_i(s, m_1, m_2, T, \mu_q)$
for all combinations $i = (\text{flavor, spin, color})$

H. Berrehrah et al, PRC 93 (2016) 044914,
Int.J.Mod.Phys. E25 (2016) 1642003,

P. Moreau et al., PRC100 (2019) 014911

PHSD 5.0

Partonic interactions: matrix elements

DQPM partonic cross sections → **leading order diagrams**

□ **Propagators** for massive bosons and fermions:

$$\text{boson propagator} = -i\delta_{ab} \frac{g^{\mu\nu} - q^\mu q^\nu / M_g^2}{q^2 - M_g^2 + 2i\gamma_g q_0}$$

$$\text{fermion propagator} = i\delta_{ij} \frac{\not{q} + M_q}{q^2 - M_q^2 + 2i\gamma_q q_0}$$

qq' → qq' scattering

gg → gg scattering

gg → gg scattering

H. Berrehrah et al, PRC 93 (2016) 044914,
Int.J.Mod.Phys. E25 (2016) 1642003,

P. Moreau et al., PRC100 (2019) 014911

Differential cross section

Initial masses: pole masses

Final masses: pole masses

Initial masses: pole masses

Final masses: integrated over spectral functions

- At lower s : off-shell $\sigma < \text{on-shell } \sigma$
since $\omega_3 + \omega_4 < \sqrt{s}$

DQPM (T, μ_q) :
transport properties at finite (T, μ_q)

Off-shell collision rate

$$\begin{aligned} \Gamma_i^{\text{off}}(T, \mu_q) &= \frac{d_i}{n_i^{\text{off}}(T, \mu_q)} \int \frac{d^4 p_i}{(2\pi)^4} \theta(\omega_i) \tilde{\rho}_i f_i(\omega_i, T, \mu_q) \\ &\times \sum_{j=q, \bar{q}, g} \int \frac{d^4 p_j}{(2\pi)^4} \theta(\omega_j) d_j \tilde{\rho}_j f_j \\ &\times \int \frac{d^4 p_3}{(2\pi)^4} \theta(\omega_3) \tilde{\rho}_3 \int \frac{d^4 p_4}{(2\pi)^4} \theta(\omega_4) \tilde{\rho}_4 (1 \pm f_3)(1 \pm f_4) \\ &\times \underbrace{|\bar{\mathcal{M}}|^2(p_i, p_j, p_3, p_4)}_{\text{off-shell density}} (2\pi)^4 \delta^{(4)}(p_i + p_j - p_3 - p_4), \end{aligned}$$

➤ **off-shell density**

$$n_i^{\text{off}}(T, \mu_q) = d_i \int \frac{d^4 p_i}{(2\pi)^4} \theta(\omega_i) 2\omega_i \tilde{\rho}_i f_i(T, \mu_q)$$

➤ **renormalized spectral-function for the time-like sector**

$$\tilde{\rho}_j(\omega_j, \mathbf{p}_j) = \frac{\rho(\omega_j, \mathbf{p}_j) \theta(p_j^2)}{\int_0^\infty \frac{d\omega_j}{(2\pi)} 2\omega_j \rho(\omega_j, \mathbf{p}_j) \theta(p_j^2)}$$

normalized to 1 and

$$\lim_{\gamma_j \rightarrow 0} \rho_j(\omega, \mathbf{p}) = 2\pi \delta(\omega^2 - \mathbf{p}^2 - M_j^2)$$

Transport coefficients: shear viscosity

➤ Kubo formalism

$$\eta^{\text{Kubo}}(T, \mu_q) = - \int \frac{d^4 p}{(2\pi)^4} p_x^2 p_y^2 \sum_{i=q, \bar{q}, g} d_i \frac{\partial f_i(\omega)}{\partial \omega} \rho_i(\omega, \mathbf{p})^2$$

$$= \frac{1}{15T} \int \frac{d^4 p}{(2\pi)^4} \mathbf{p}^4 \sum_{i=q, \bar{q}, g} d_i ((1 \pm f_i(\omega)) f_i(\omega)) \rho_i(\omega, \mathbf{p})^2$$

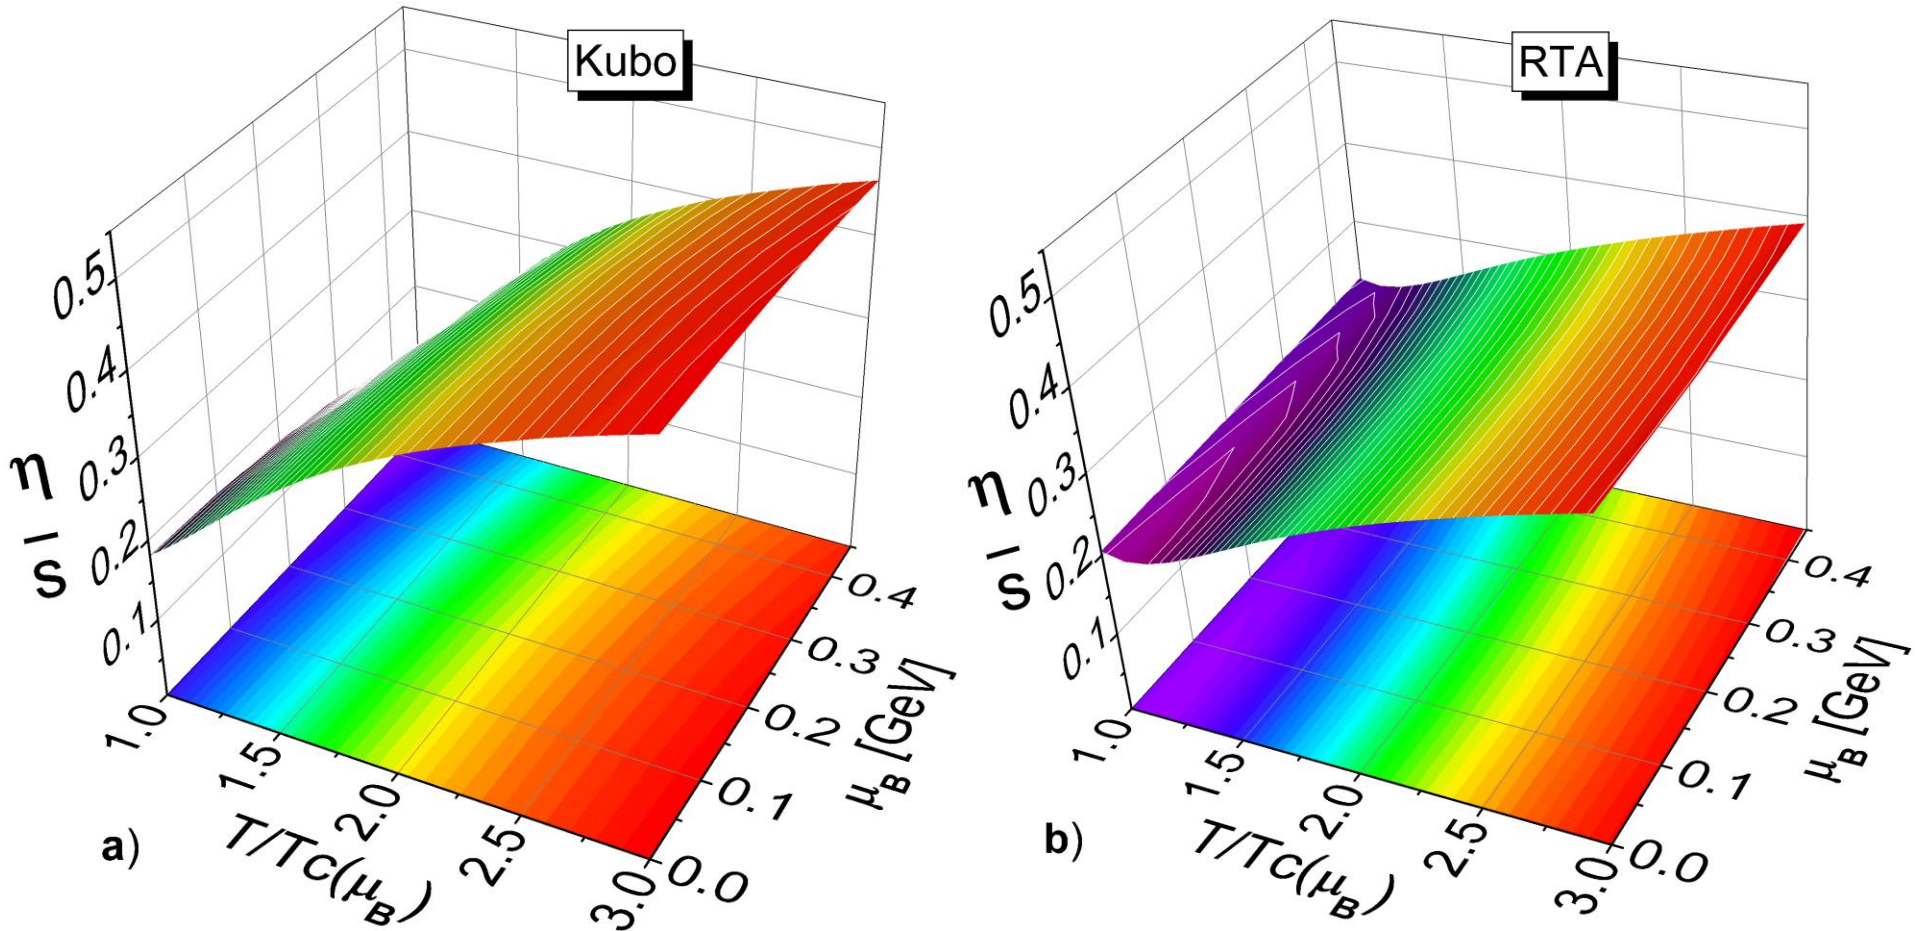

➤ Relaxation Time Approximation

$$\eta^{\text{RTA}}(T, \mu_q) = \frac{1}{15T} \int \frac{d^3 p}{(2\pi)^3} \sum_{i=q, \bar{q}, g} \left(\frac{\mathbf{p}^4}{E_i^2 \Gamma_i(\mathbf{p}_i, T, \mu_q)} d_i ((1 \pm f_i(E_i)) f_i(E_i)) \right) + \mathcal{O}(\Gamma_i)$$

Rate Γ (all diagrams for M in the pole mass)

Transport coefficients: shear viscosity

➤ Very **weak dependence** of share viscosity on μ_B

Transport coefficients: bulk viscosity

➤ Relaxation Time Approximation

$$\zeta^{\text{RTA}}(T, \mu_q) = \frac{1}{9T} \int \frac{d^3p}{(2\pi)^3} \sum_{i=q, \bar{q}} \left(\frac{\mathbf{p}^4}{E_i^2 \Gamma_i(\mathbf{p}_i, T, \mu_q)} d_i ((1 \pm f_i(E_i)) f_i(E_i)) \right) [\mathbf{p}^2 - 3c_s^2 (E_i^2 - T^2 \frac{dm_q^2}{dT^2})]^2$$

from DQPM parametrization

rate

➤ Very **weak dependence** of bulk viscosity on **μ_B**

QGP:
in-equilibrium → off-equilibrium

Parton-Hadron-String-Dynamics (PHSD)

PHSD is a **non-equilibrium microscopic transport approach** for the description of **strongly-interacting hadronic and partonic matter** created in heavy-ion collisions

Dynamics: based on the solution of **generalized off-shell transport equations** derived from Kadanoff-Baym many-body theory

Initial A+A
collision

Partonic phase

Hadronization

Hadronic phase

Initial A+A collisions :

$N+N \rightarrow$ **string formation** \rightarrow decay to pre-hadrons + leading hadrons

Formation of QGP stage if local $\varepsilon > \varepsilon_{\text{critical}}$:

dissolution of **pre-hadrons** \rightarrow partons

Partonic phase - QGP:

QGP is described by the **Dynamical QuasiParticle Model (DQPM)** matched to reproduce **lattice QCD EoS** for finite T and μ_B (crossover)

- **Degrees-of-freedom:** strongly interacting quasiparticles: **massive quarks and gluons (g, q, q_{bar})** with sizeable collisional widths in a self-generated mean-field potential
- **Interactions:** (quasi-)elastic and inelastic collisions of partons

Hadronization to colorless off-shell mesons and baryons:

Strict 4-momentum and quantum number conservation

Hadronic phase: hadron-hadron interactions – off-shell HSD

Extraction of (T, μ_B) in PHSD

For **each space-time cell** of the PHSD:

- Calculate the local energy density ϵ^{PHSD} and baryon density n_B^{PHSD}

1) Energy density ϵ^{PHSD}

- In **each space-time cell** of the PHSD, the **energy-momentum tensor** is calculated by the formula:

$$T^{\mu\nu} = \sum_i \frac{p_i^\mu p_i^\nu}{E_i}$$

- Diagonalization of the energy-momentum tensor to get the energy density and pressure components expressed in **the local rest frame (LRF)**

$$T^{\mu\nu} = \begin{pmatrix} T^{00} & T^{01} & T^{02} & T^{03} \\ T^{10} & T^{11} & T^{12} & T^{13} \\ T^{20} & T^{21} & T^{22} & T^{23} \\ T^{30} & T^{31} & T^{32} & T^{33} \end{pmatrix} \rightarrow \begin{pmatrix} \epsilon^{LRF} & 0 & 0 & 0 \\ 0 & P_x^{LRF} & 0 & 0 \\ 0 & 0 & P_y^{LRF} & 0 \\ 0 & 0 & 0 & P_z^{LRF} \end{pmatrix} \rightarrow \epsilon^{\text{PHSD}}$$

2) Net-baryon density n_B^{PHSD}

$$\Rightarrow n_B = \gamma_E (J_B^0 - \vec{\beta}_E \cdot \vec{J}_B) = \frac{J_B^0}{\gamma_E}$$

Net-baryon current: $J_B^\mu = \sum_i \frac{p_i^\mu}{E_i} \frac{(q_i - \bar{q}_i)}{3}$

Eckart velocity $\vec{\beta}_E = \vec{J}_B / J_B^0$

Extraction of (T, μ_B) in PHSD

□ For each PHSD cell :

In order to extract (T, μ_B) use IQCD relations (up to 4th order) - Taylor series :

$$\left\{ \begin{array}{l} \frac{n_B}{T^3} \approx \chi_2^B(T) \left(\frac{\mu_B}{T} \right) + \dots \\ \Delta\epsilon/T^4 \approx \frac{1}{2} \left(T \frac{\partial \chi_2^B(T)}{\partial T} + 3\chi_2^B(T) \right) \left(\frac{\mu_B}{T} \right)^2 + \dots \end{array} \right.$$

Use baryon number susceptibilities χ_n from IQCD

➔ obtain (T, μ_B) by solving the system of coupled equations using ϵ^{PHSD} and n_B^{PHSD}

* Done by Newton-Raphson method

Input:
 ϵ^{PHSD} and n_B^{PHSD}

Output:
 T, μ_B

Extraction of (T, μ_B) in PHSD

For **each space-time cell** of the PHSD:

- Correction for the medium anisotropy to extract values for (T, μ_B)

$$\epsilon^{\text{anis}} = \epsilon^{\text{EoS}} r(x)$$

$$P_{\perp} = P^{\text{EoS}} [r(x) + 3xr'(x)]$$

$$P_{\parallel} = P^{\text{EoS}} [r(x) - 6xr'(x)]$$

$$r(x) = \begin{cases} \frac{x^{-1/3}}{2} \left[1 + \frac{x \operatorname{arctanh} \sqrt{1-x}}{\sqrt{1-x}} \right] & \text{for } x \leq 1 \\ \frac{x^{-1/3}}{2} \left[1 + \frac{x \operatorname{arctan} \sqrt{x-1}}{\sqrt{x-1}} \right] & \text{for } x \geq 1 \end{cases}$$

Ryblewski, Florkowski, Phys.Rev. C85 (2012) 064901

- We have to solve the following system in PHSD:

Done by Newton-Raphson method

$$\begin{cases} \epsilon^{\text{EoS}}(T, \mu_B) = \epsilon^{\text{PHSD}} / r(x) \\ n_B^{\text{EoS}}(T, \mu_B) = n_B^{\text{PHSD}} \end{cases}$$

Summary / Outlook

- ❑ **(T, μ_B) -dependent** cross sections and masses/widths of quarks and gluons have been implemented in PHSD
- ❑ **High- μ_B** regions are probed at **low $\sqrt{s_{NN}}$** or **high rapidity** regions
- ❑ But, QGP fraction is **small** at low $\sqrt{s_{NN}}$:
 - ➔ no effects seen in **bulk observables**

❑ Outlook:

- Study more sensitive probes to finite- μ_B dynamics
- More precise EoS finite/large μ_B
- Possible 1st order phase transition at large μ_B ?!

Thank you for your attention!

-  Baryons
-  Antibaryons
-  Mesons
-  Quarks
-  Gluons

Au + Au $\sqrt{s_{NN}} = 200$ GeV
