Deploying EPICS Applications with rsync-dist

Thursday 6 June 2019 14:00 (10 minutes)

We present rsync-dist, a tool to deploy build artefacts from an EPICS application to remote servers. It uses ssh for authentication and authorization, log files for auditing, and supports unlimited rollback. In contrast to standard CI tools, its use is decoupled from source version control to allow developers to easily install test and debug versions of their software.
