Workshop of the LHC Beam Commissioning Working Group, Evian, 19-20 January 2010

# CONTENTS

- Historic of the energy ramps during the 2009 run
- Losses and transmission
- Evolution of orbit, tune and chromaticity
- Feed forward and feed back
- Settings incorporation for various systems
- Software tools
- Conclusions and outlook

# HISTORICAL OF RAMPS

#	Timestamp	Pre cycle	B1 in, protons	B2 in, protons	Q FB, B1	Q FB, B2	B1 out protons	B2 out protons
1		bad	2.6E9	-	no	-	≈ 5E7	-
2								-
3								1.9E8
4							top (??)	got to top, no BI data
5							≈ 5E7 (noise level)	
6	2009-12-14 02:31:30.575							1.1E10
7	2009-12-15 21:12:33.680	ok	1.52E10	1.62E10	yes	yes	1.52E10	1.58E10
8	2009-12-16 00:49:06.019	ok	1.15E10	1.9E10	yes	yes	1.15E10	1.89E10

General conditions:  
 No separation,  
 No orbit FB,  
 No Q' continuous measurement,  
 "constant" incorporation of injection trims,  
 Ramp with masked BPM interlocks in P6,  
 Collimators at injection settings,  
 RF: synch. and phase loops on, constant voltage,  
 no attempt to blow up emittance

# SOFTWARE TOOLS

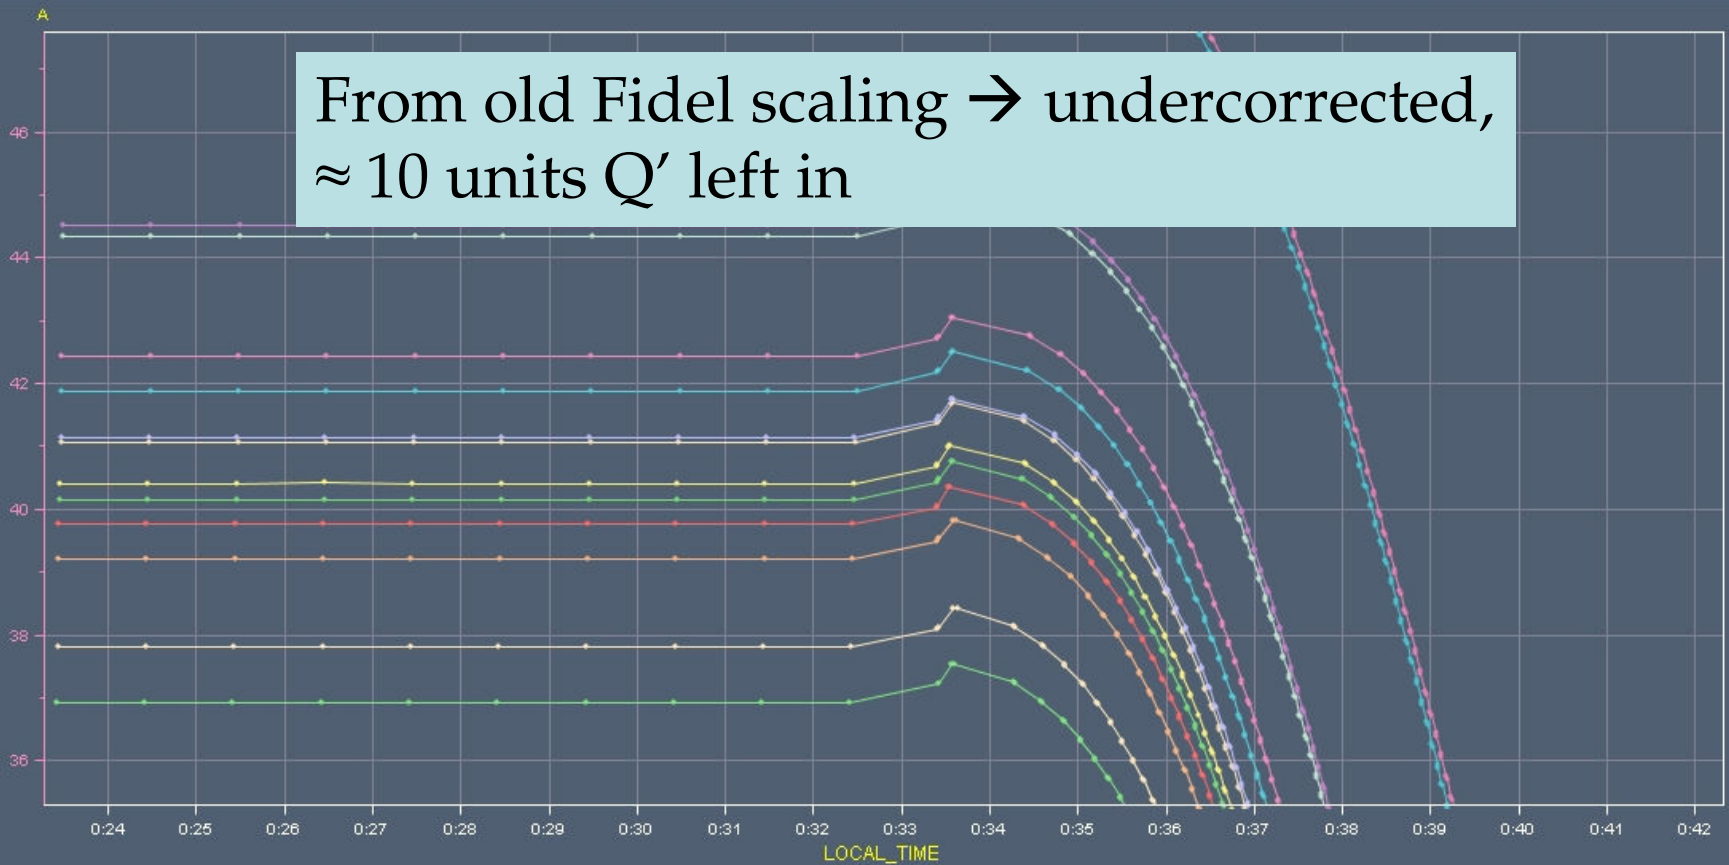

- Feed forward tool by Mario/Mike
- Generation (to incorporate injection trims)
  - In general, incorporation was done manually by the specialist.  
In future could it be sequencer task?
- Sequencer/Equip State to load functions and drive the systems
- Tune meter
- Fixed displays for energy, FBCT, bunch profiles, BLM...

# SNAPBACK CORRECTION

# FEED FORWARD

Used to tackle the tune evolution. A specific application exists, which computes and applies the trims taking input from logging of previous ramps (Mario)

$$Q_{\text{ref}}(\text{LSA}) - Q_{\text{meas}}(\text{MDB}) = Q_{\text{trim}} \rightarrow \text{LSA } Q \text{ trim knobs for the next ramp}$$

When the FB was on, the feedback contribution was isolated:

$$I_{\text{RQTF-RQTD}}(\text{MDB}) - I_{\text{RQTF-RQTD}}(\text{FF}) = I_{\text{RQTF-RQTD}}(\text{FB})$$

... then translated in an incremental Q trim for the next ramp. A little more cumbersome (working with currents)

- In one case (4<sup>th</sup> ramp) sign was wrong, error was taken care of by FB
- FF would be possible for orbit and coupling as well
- Not logged (enough), filtered from MDB to LDB
- Completely empirical, corrects the resultant: need a mechanism to interact with TF improvements

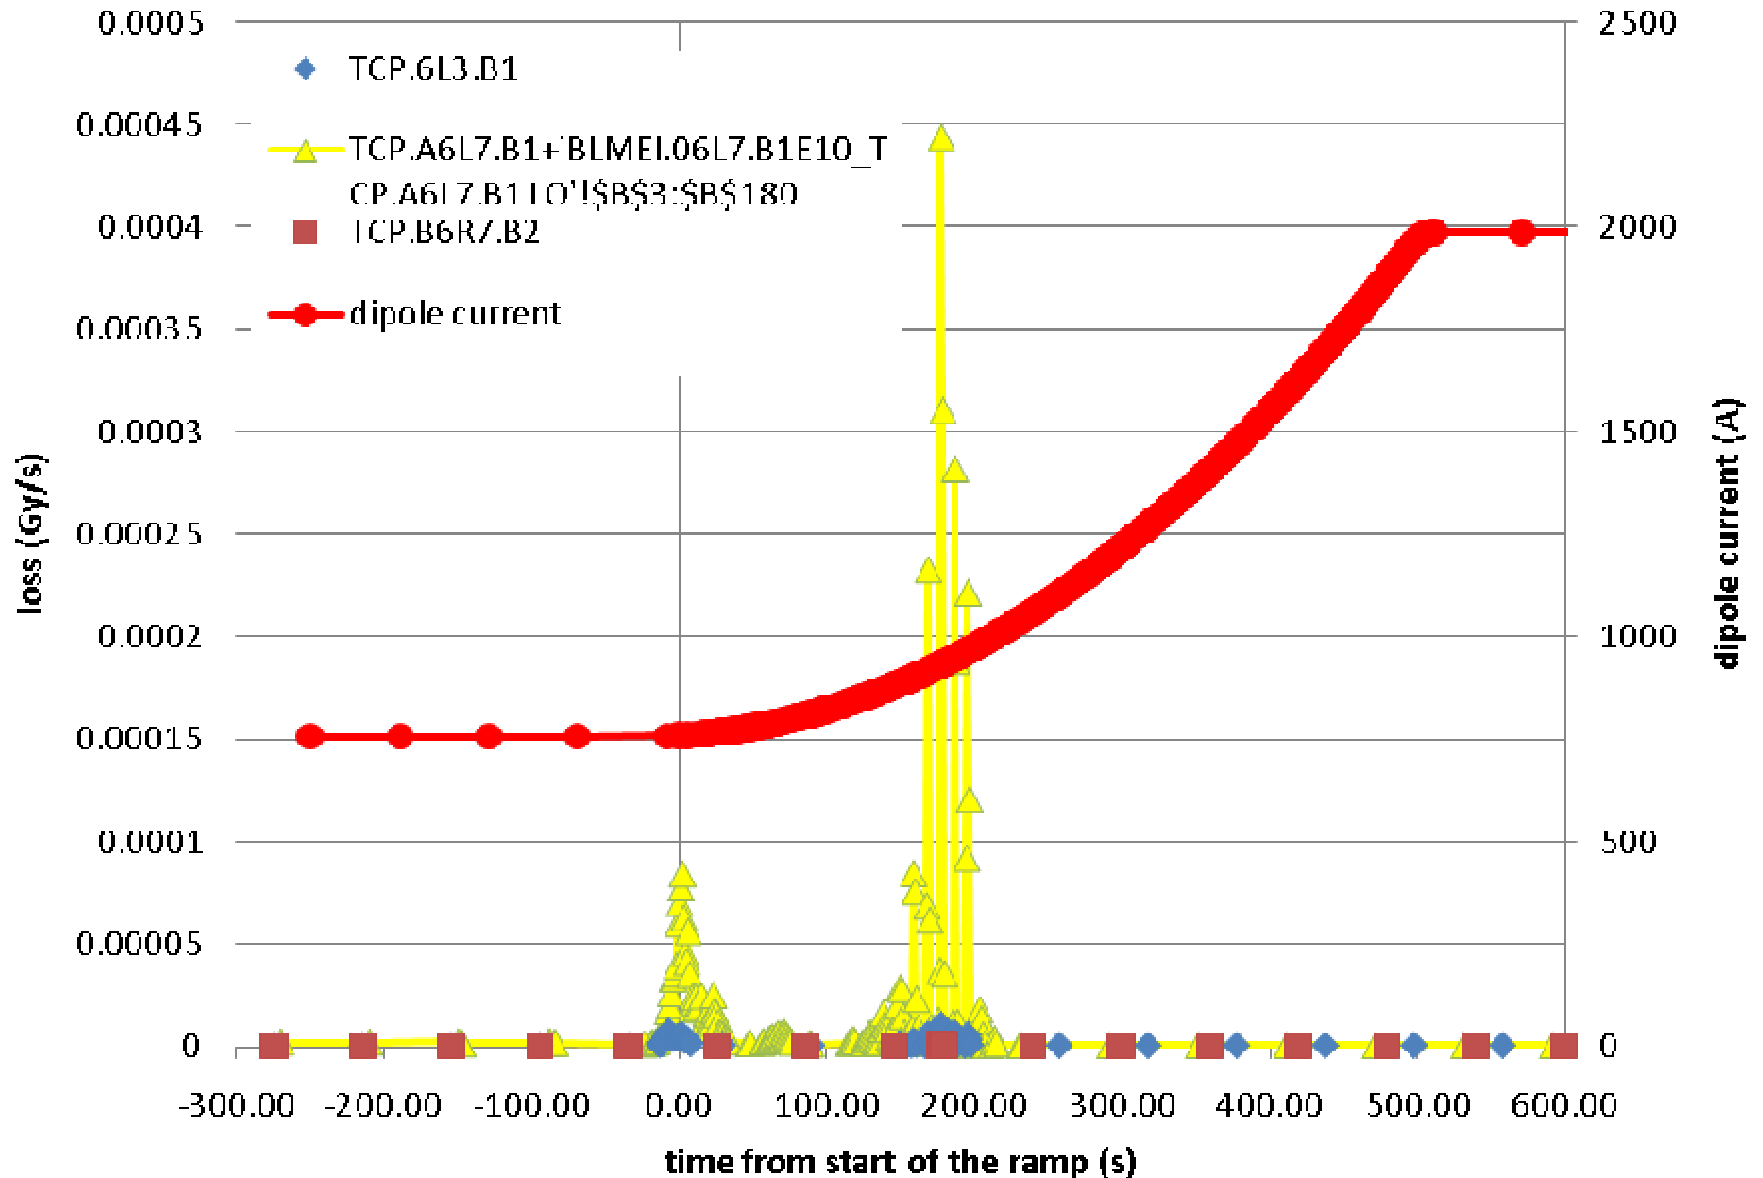

# RAMP 1

B1 reached 560 GeV, lost on 3<sup>rd</sup> order resonance

# “PRIMARY” LOSS 1<sup>ST</sup> RAMP

# RAMP 2

Proper pre cycle, B1 to 1.18 TeV, "golden orbit",  
beam finally lost on  $Q_v=0.3333$

# “PRIMARY” LOSS 2<sup>ND</sup> RAMP

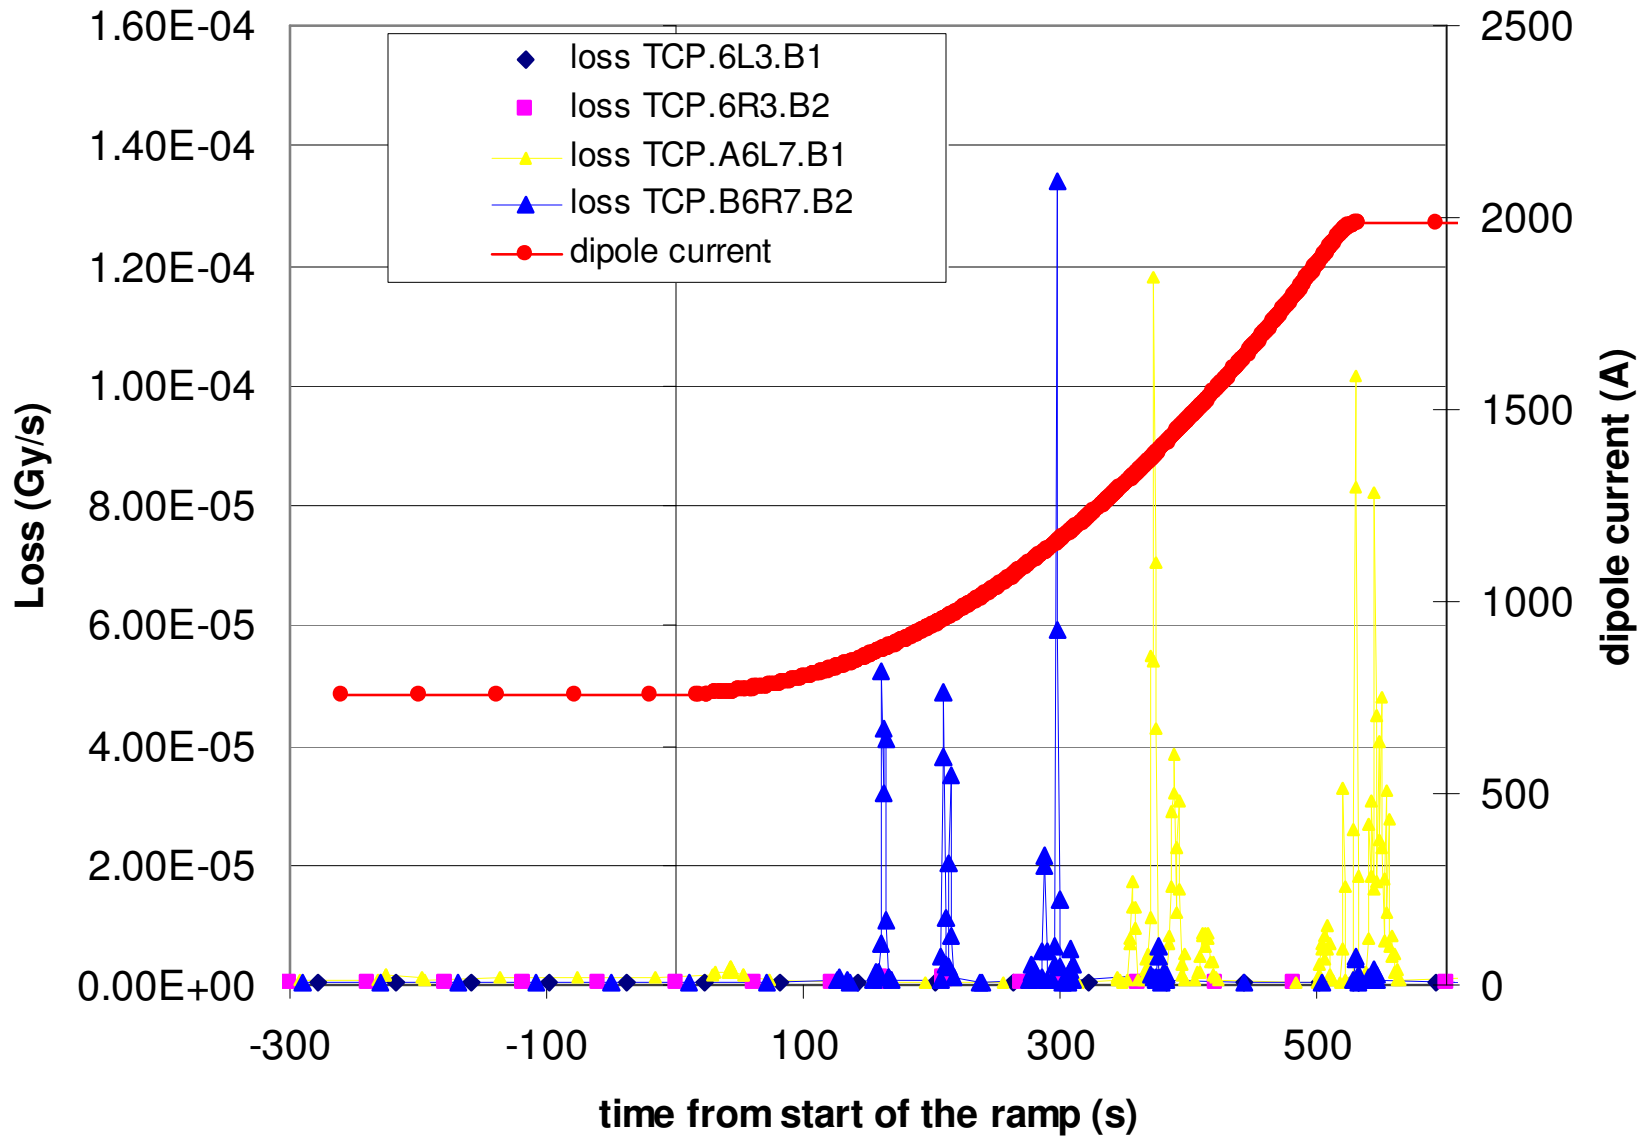

# RAMP 3

- 2 beams up to 1.18 TeV, no FB, FF from ramp 2

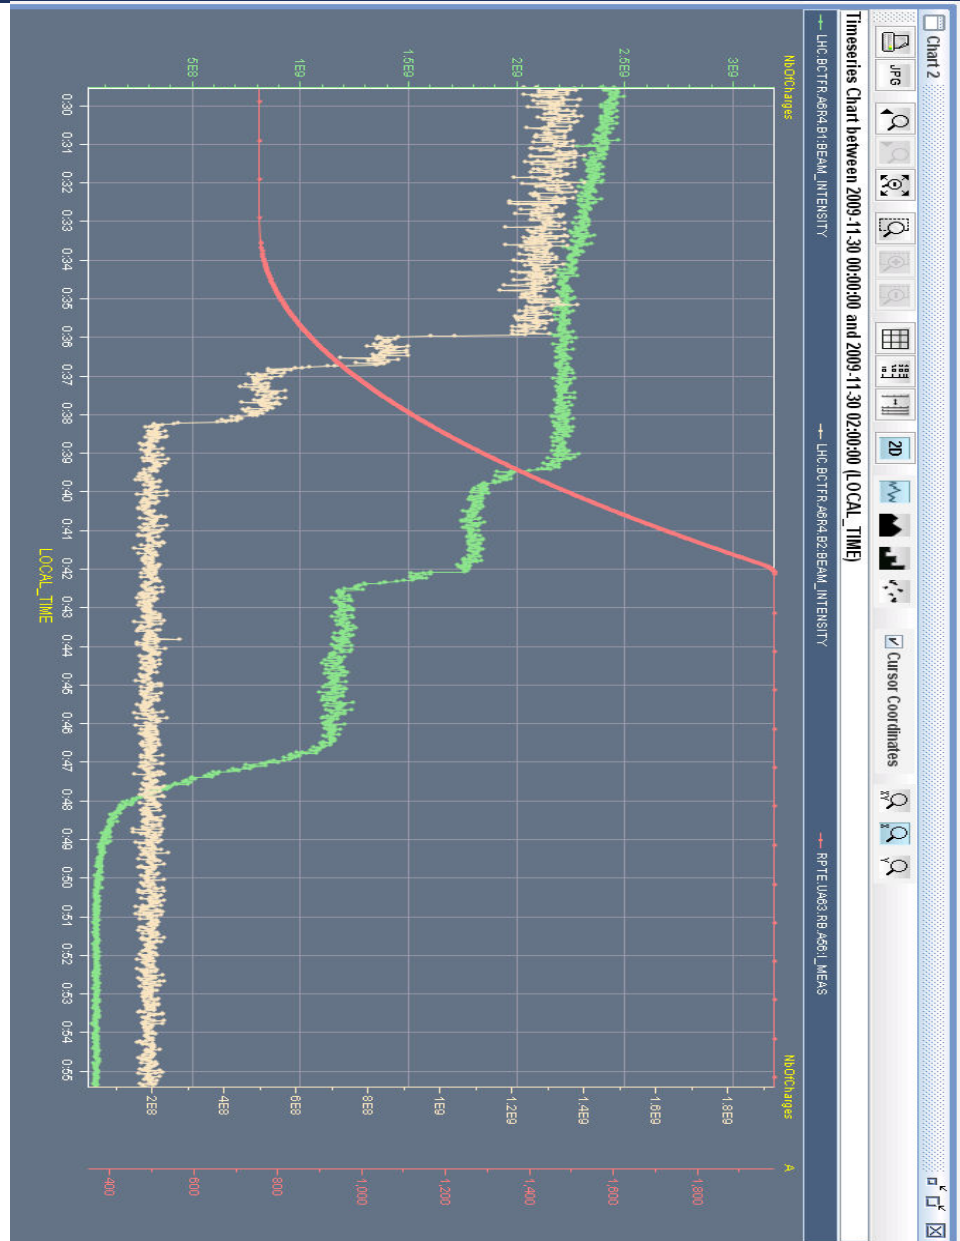

# “PRIMARY” LOSS 3<sup>RD</sup> RAMP

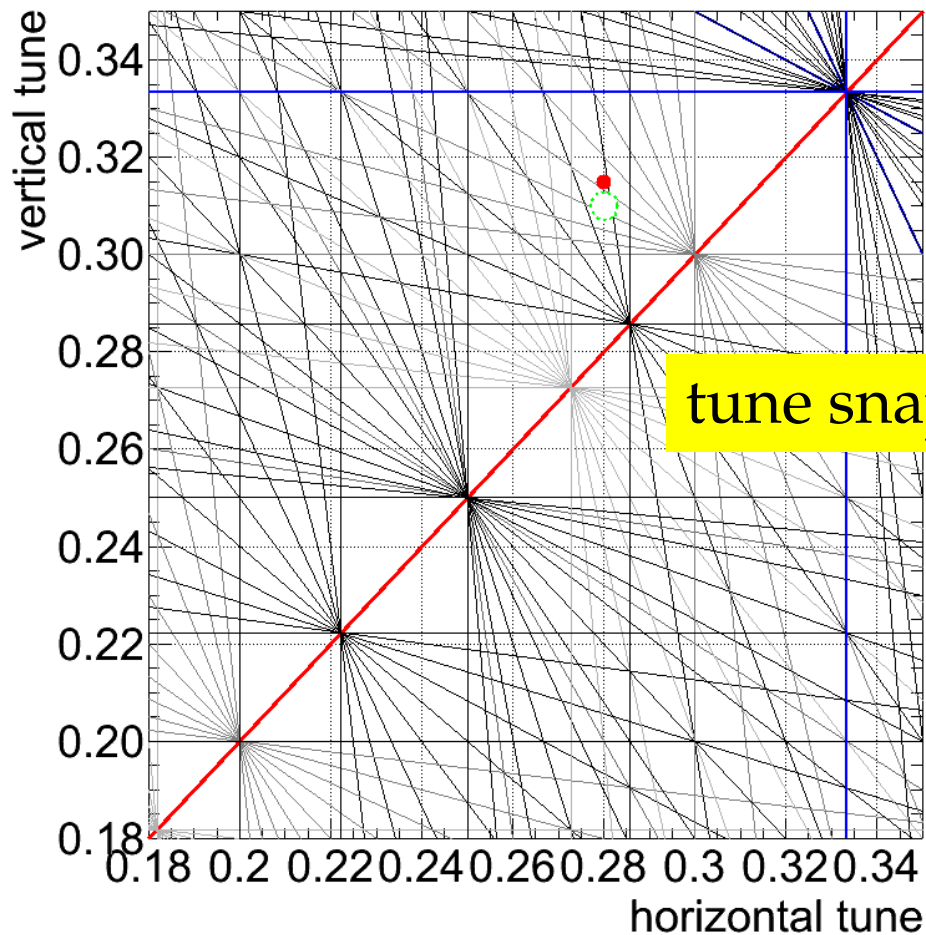

# MAX LOSSES / BCT (3<sup>RD</sup> RAMP)

# 4<sup>TH</sup> RAMP (B2 WITH FF+FB)

What we saw in the CCC

Reconstructed bare tunes B2

tune snapback is very small (about 0.005).

# RAMPS 5 AND 6

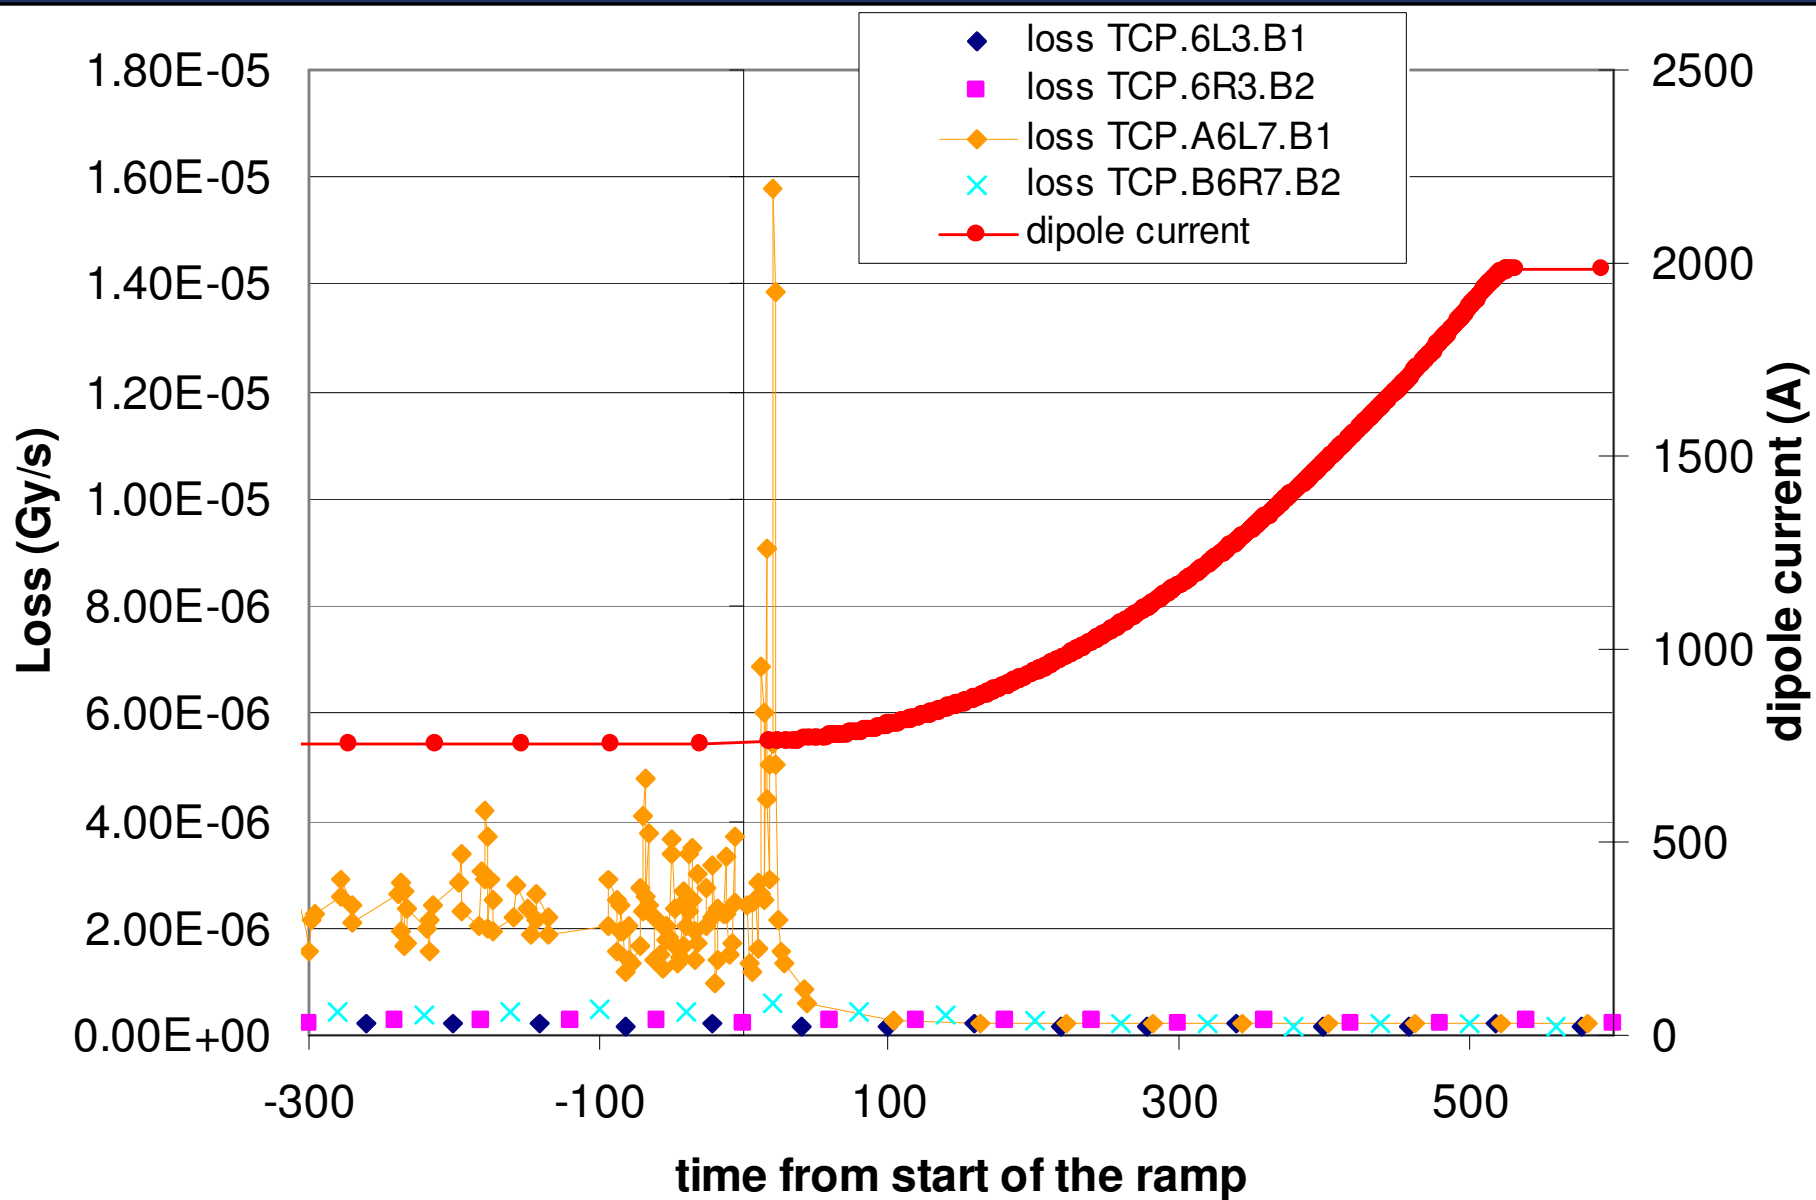

# RAMPS 7 AND 8

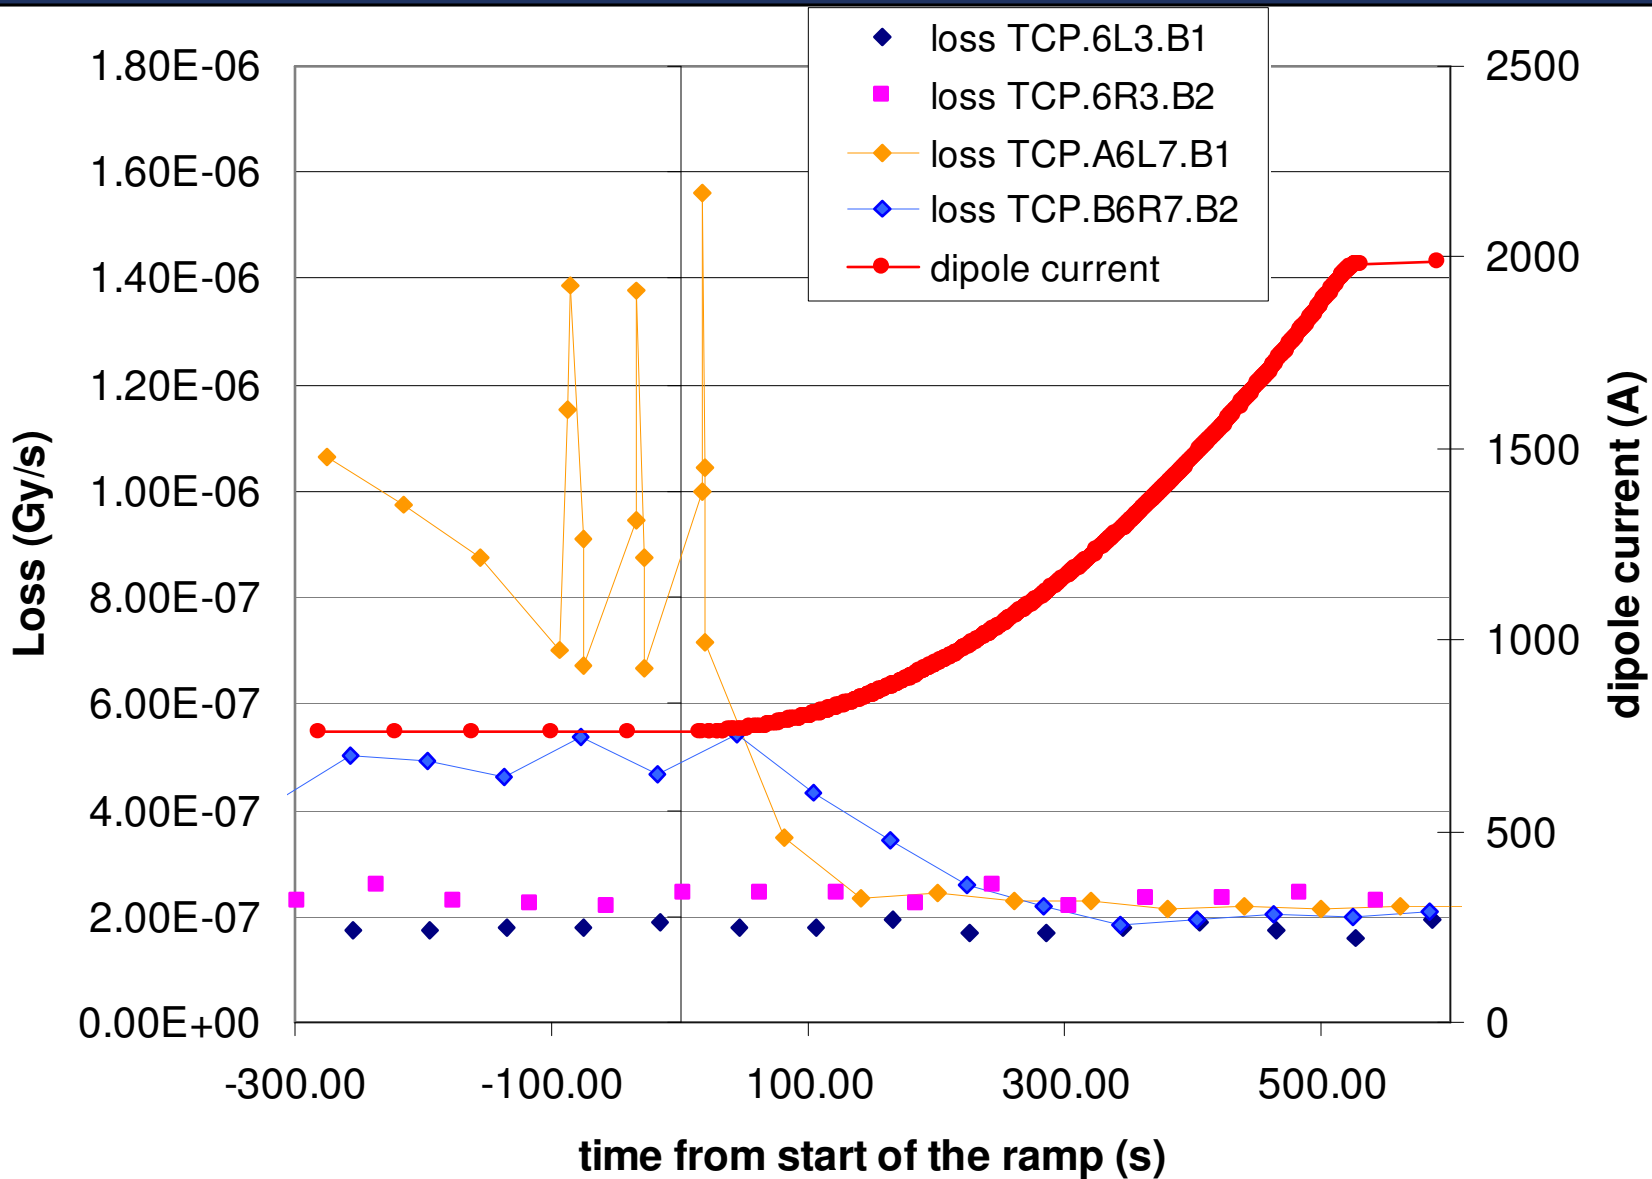

# “PRIMARY” LOSS 5<sup>TH</sup> RAMP

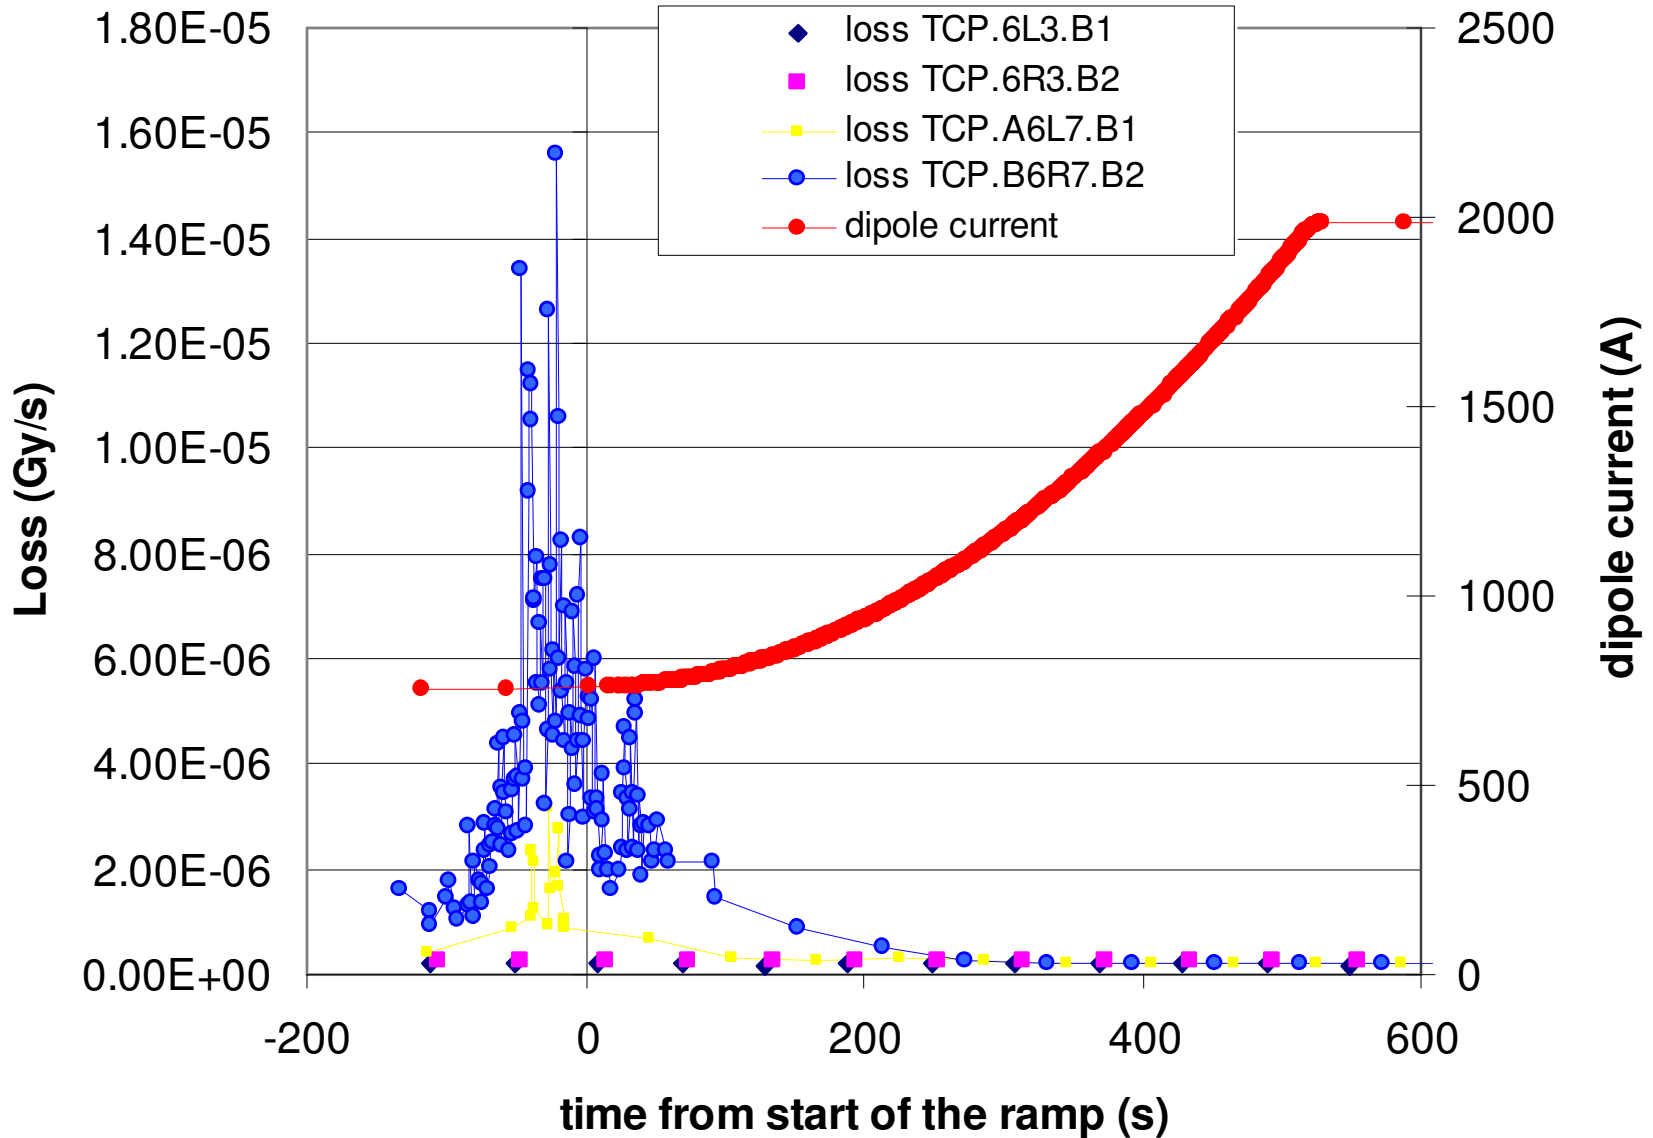

# “PRIMARY” LOSS 6<sup>TH</sup> RAMP

# “PRIMARY” LOSS 7<sup>TH</sup> RAMP

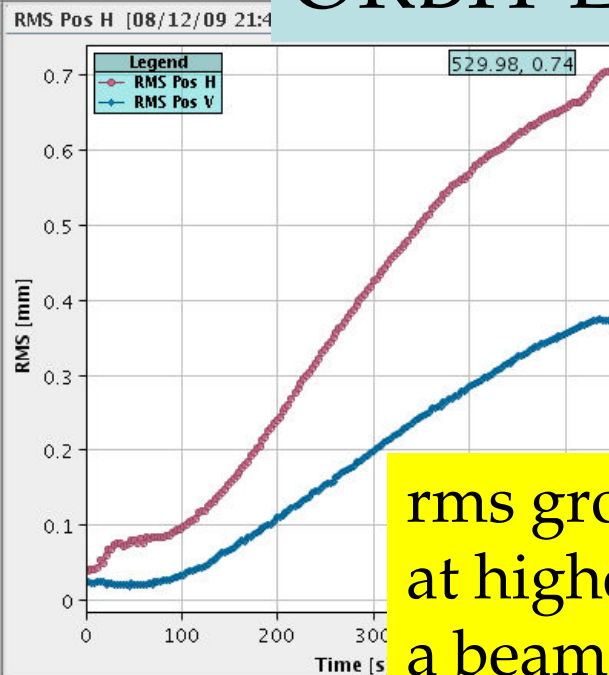

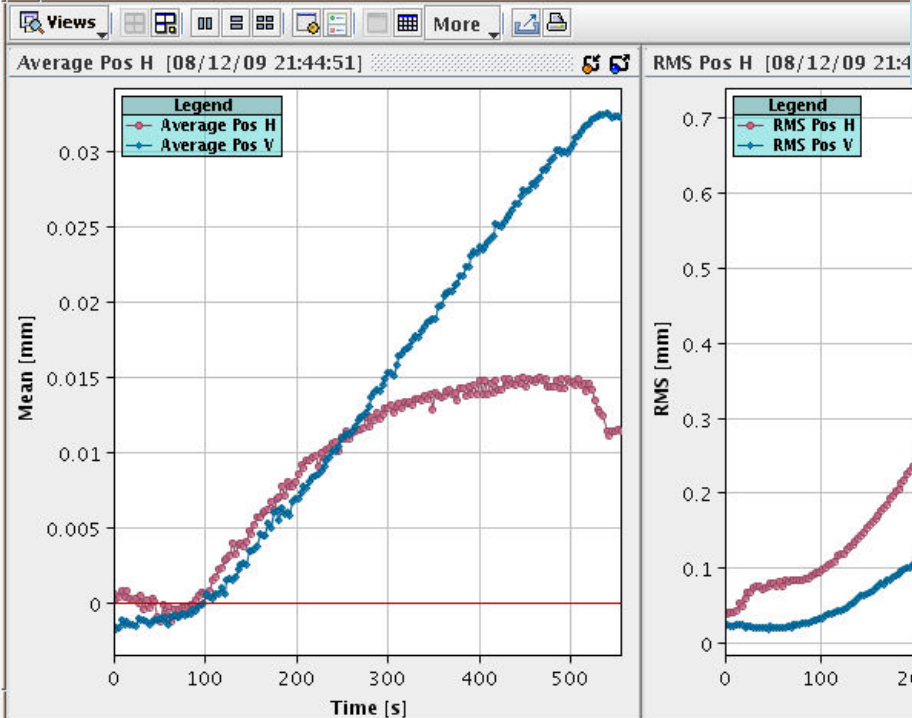

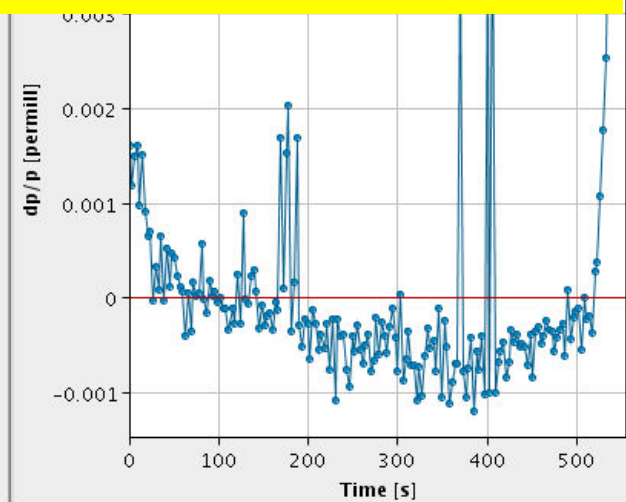

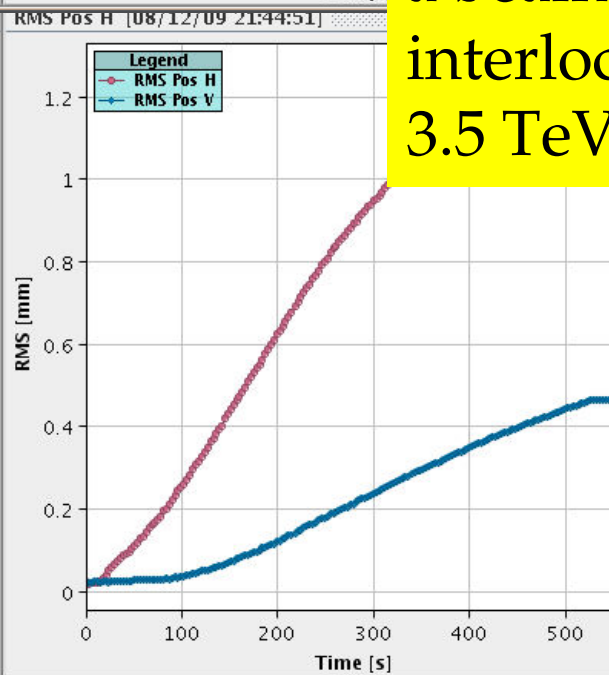

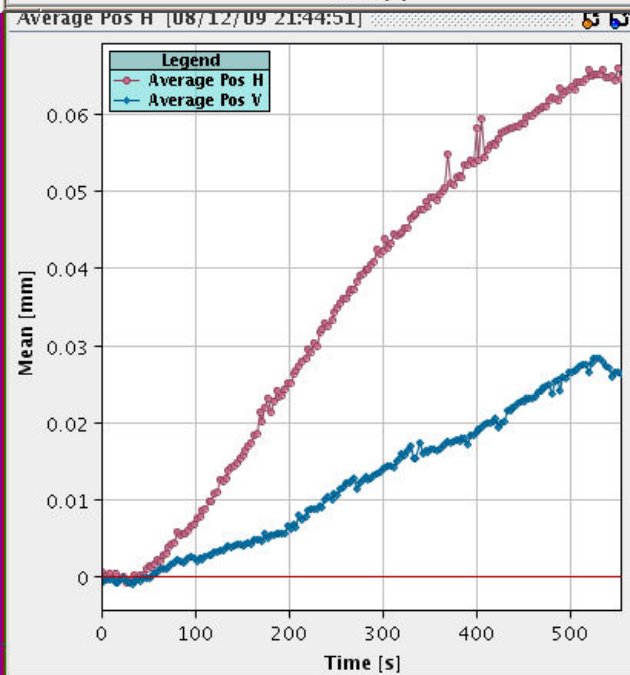

# "PRIMARY" LOSS (8<sup>TH</sup> RAMP)

## ORBIT EVOLUTION

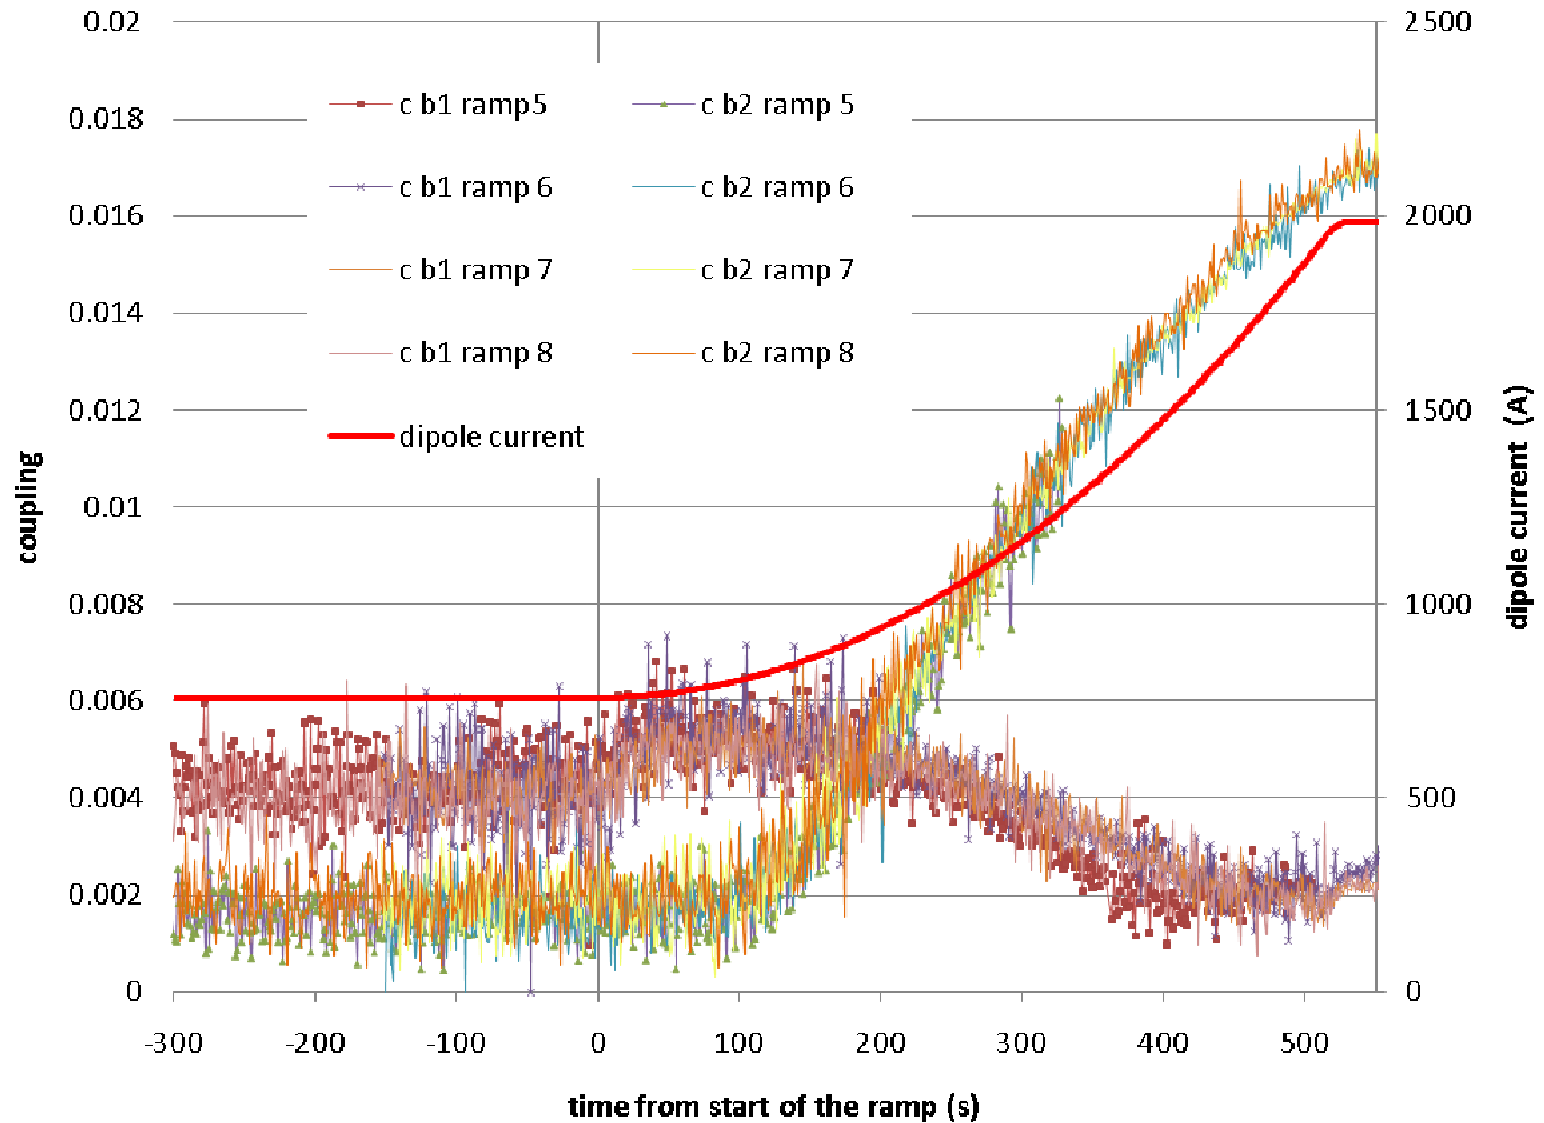

rms growth if extrapolated  
at higher energy will trigger  
a beam dump from  
interlocked BPM in P6 →  
3.5 TeV needs orbit feedback

# COUPLING EVOLUTION

# CHROMATICITY EVOLUTION

- Not measured continuously (problem of tune “noise”)
- $Q'$  measurements before and after the last ramps:
  - Ramp #4 → beam 1  $\Delta Q'_H \approx -6.3$ ,  $\Delta Q'_V \approx -14.7$
  - Ramp #5 → beam 1  $\Delta Q'_H \approx -2.7$ ,  $\Delta Q'_V \approx -13.2$
  - Ramp #6 → beam 1  $\Delta Q'_H \approx -3.0$ ,  $\Delta Q'_V \approx -10.8$
  - Ramp #6 → beam 2  $\Delta Q'_H \approx -9.2$ ,  $\Delta Q'_V \approx -8.1$
- Possible sources: imperfect  $b_3$  corrections for snapback and magnetization components, hysteresis of MS, ...

# DISCUSSION

- Possible sources of Q evolution during the ramp:
  - $B_2/B_1$  tracking error (visible during decay and snapback)
  - Feed down from CO in the main sextupoles (was checked with measured orbit and betas, effect is small,  $\approx 10^{-4}$ ).
  - Feed down from CO in random (uncorrected)  $b_3$  of dipoles (also checked with measured orbit and found small  $\approx 10^{-3}$ )
  - MCS misalignments and powering. From preliminary calculations this appears to be a good candidate to explain the tune drift.
  - Tracking error MCS- $b_3$  also gives a contribution
- The effect is bigger for beam 2, as it is the case for orbit and coupling (...?)

# CONCLUSIONS AND ISSUES

- Ramping was easier than anticipated, however several issues are still on the table:
  - Beam parameters evolution not fully understood (in particular the differences between beams)
  - Fidel corrections to be updated with best estimate for snapback correction
  - Disentangle feed forward and TF updates
  - Orbit feedback at least in the dump and collimation regions
  - Chromaticity measurement on line
  - Incorporate incorporation (in the sequence)
  - RF: commissioning of emittance blow up, global orbit FB
  - Link logging of BI to beam operation through mode
  - Ramp with separation bumps
