

CMS Experience with Adoption of the Community-supported DD4hep Toolkit

Carl Vuosalo

University of Wisconsin-Madison

Ianna Osborne

FNAL

Presented at CHEP 2019,
The 24th International Conference on Computing in High Energy and Nuclear Physics
on behalf of the CMS Collaboration

Outline

- Motivation to adopt DD4hep
- Migration process and scope
- Code migration techniques
- Migration challenges
- Good practices for migration
- Summary

Need for DD4hep

- The Compact Muon Solenoid (CMS) collaboration developed and maintained for many years its own **custom detector description** (DD) for detector geometry
- CMS DD **disadvantages**:
 - It is a **singleton** that doesn't support multi-threading
 - CMS software uses advanced **parallelization** techniques for improved performance that are **blocked by singletons**
 - See CMS poster “Concurrent Conditions Access across Validity Intervals in CMSSW” by Chris Jones for parallelization example
 - Old code that is costly to maintain and enhance
 - Accumulated defects and obsolete sections over many years
 - No easy path to adopt innovations and new technology

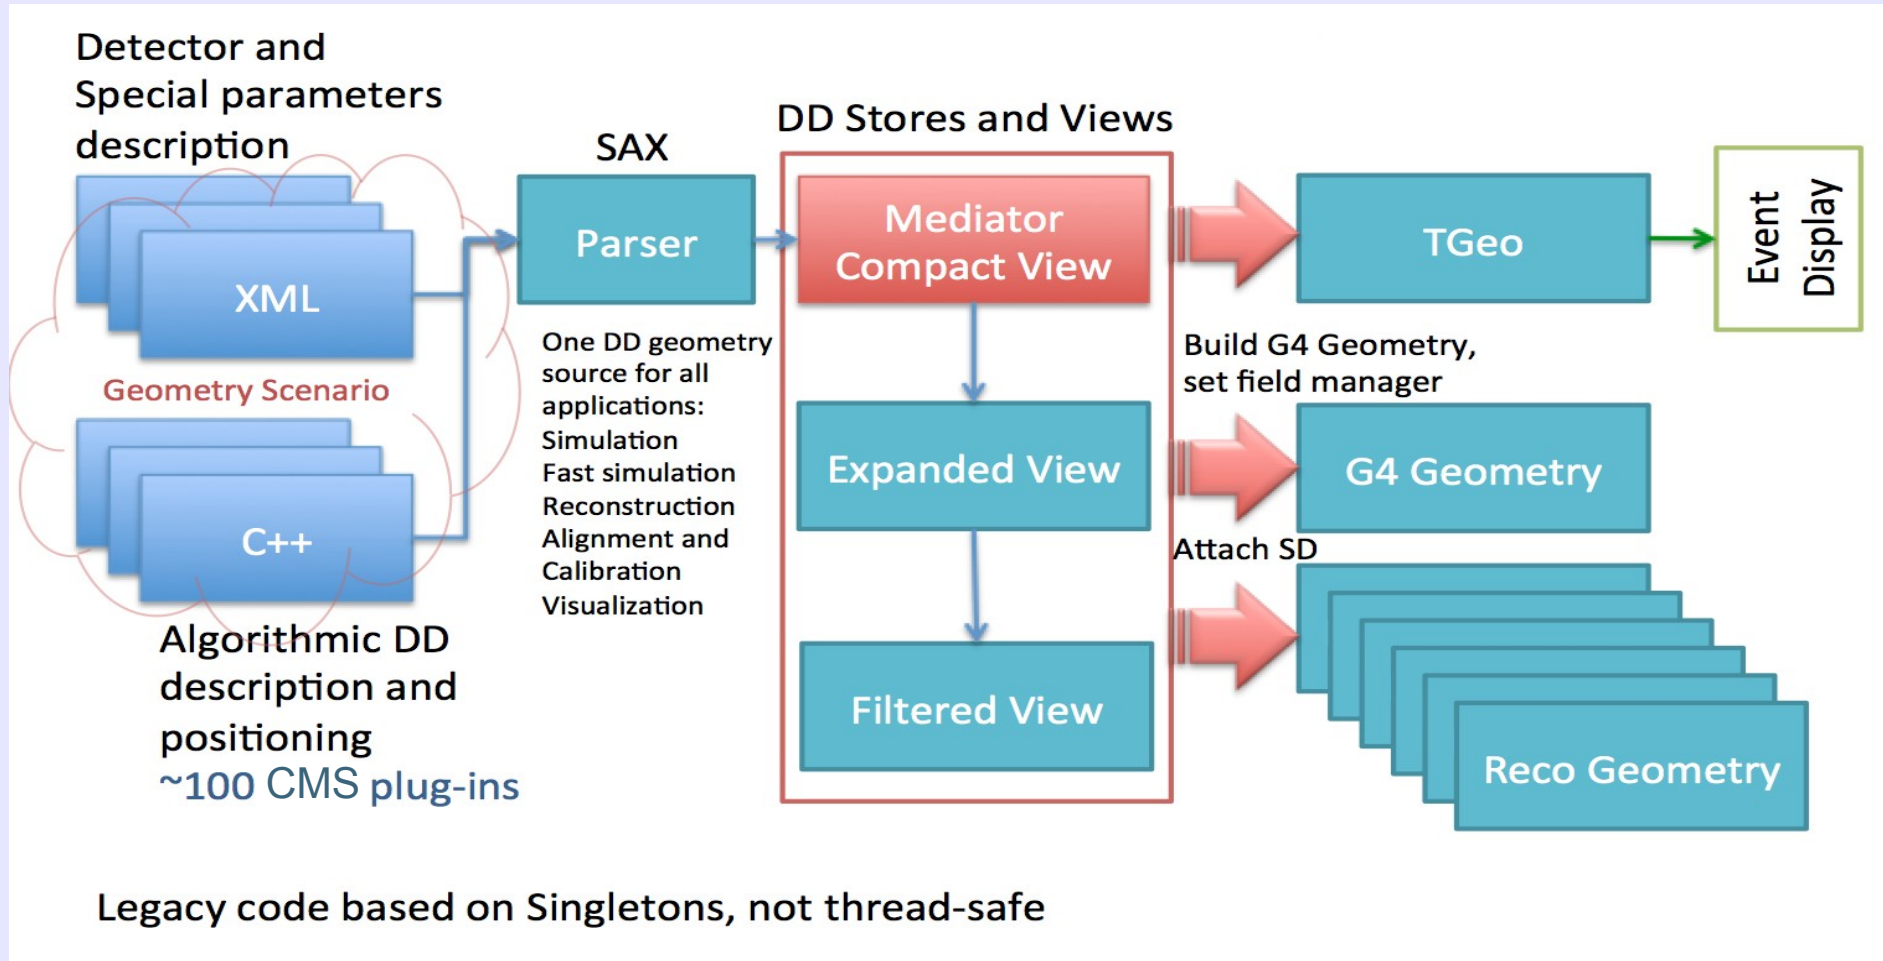

CMS Detector Geometry

2021 model
built with
DD4hep

Old CMS DD

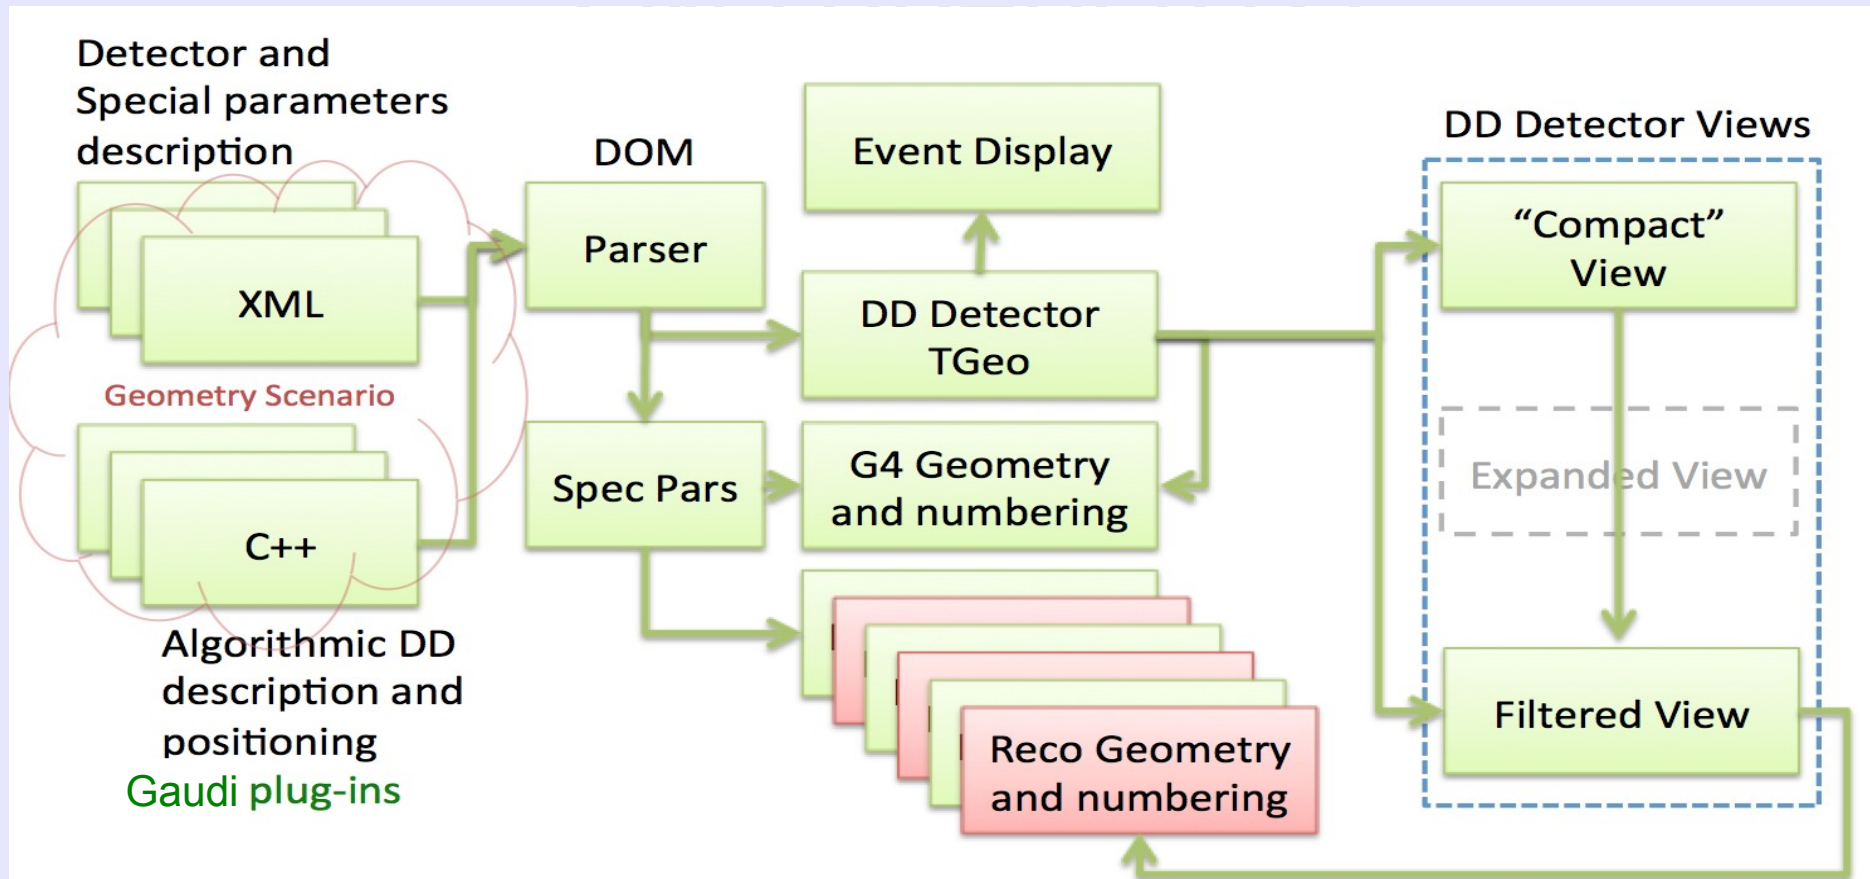

Benefits of DD4hep

- Supports **multi-threading**
- Fully featured
- **Community-supported** toolkit
 - Widely used in HEP by CALICE, FCC, ILC, LHCb, etc.
 - Benefits from innovations and contributions from across HEP community
- Will continue to **evolve** with advancing technology
- Commitment for years of maintenance and enhancement
- Development based at **CERN**
- DD4hep team very **responsive** to users' needs

CMS Using DD4hep

DD Detector Views implemented to optimize geometry navigation and minimize downstream code changes

Additional Benefits of Migration

- Migration provides opportunity to **improve** code base
 - › Drop unused shapes, features, and obsolete code
 - › Fix previously undetected overlaps of geometric volumes
 - › Refine geometry and enhance testing and validation
- Motivates improvement of DD4hep to meet CMS requirements
- Builds expertise among developers doing migration
- Demonstrates value of community-supported software
- HEP community faces huge upcoming computing challenges like HL-LHC
 - › Will need to **pool efforts** to meet these challenges

Migration Timeline

2018

Scope of Migration

- CMSSW, the CMS software system, has about 6.5 million lines of code
 - Mostly C++ code, some Python and XML
 - Only small fraction needs to be migrated
- Detector geometry used for event simulation and reconstruction
- Roughly 150,000 lines of C++/Python code require migration
 - Several hundred files
 - Not all lines of code have to be changed, but they must at least be reviewed
 - 1.5 million lines of XML detector geometry description
 - XML requires only minor fixes, no major changes
 - 61 C++ algorithms called from XML require migration
- Half dozen developers performing migration

Techniques for Migrating Code

- Evaluation phase
 - › Separate package for migrated code
 - › Leave old code untouched
- Migration phase combines various approaches
 - › Put migrated code into mainline development branch (“integration build”)
 - › Parallel migrated versions of some files put in `dd4hep` directories or given names starting with `DD4hep_`
 - Python script loads desired version
 - › Some sections of migrated code activated by `fromDD4hep` flag
 - › Some classes templated to provide old and migrated versions
 - › Try to balance:
 - Preserving old behavior for validation of migrated code
 - Minimizing code duplication

Integration of DD4hep

- DD4hep handled as external tool in CMSSW
 - DD4hep built by CMS build system
 - CMS keeps up with DD4hep releases
 - Recent issue: DD4hep revised its cmake configuration
 - Required CMSSW fix to build new version of DD4hep
- DD4hep uses Gaudi plug-in format
 - CMS has its own plug-in format
 - CMS added rule to build system to support Gaudi plug-ins
- CMSSW uses both dynamic and static libraries
 - DD4hep added support for static libraries

Migration Challenges

- DD4hep **lacked** seven special features **required** by CMS geometry code
 - › These features include special shapes and use of a left-handed coordinate system
 - › DD4hep team **enhanced DD4hep** to include these features
- CMS XML geometry files have improperly defined shapes and undefined object references
 - › Fixes made or in progress
- Old, obscure code is difficult to migrate and test

Good Practices for Migration

- Perform **evaluation and test migration** to ensure toolkit will meet **requirements**
- Identify **special exceptions** in legacy code that will take most time to migrate
 - Assess whether special features can be dropped
 - If not, schedule sufficient resources for their migration
- Provide developers with migration examples and **instructions** to facilitate migration process
- Engage with toolkit developers to **enhance toolkit**
- Use migration as opportunity for overall software improvement

Acknowledgments

- Many thanks to the following for their contributions to this migration project:
 - Sunanda Banerjee, FNAL
 - Markus Frank, CERN, and the DD4hep team
 - Andres Vargas Hernandez, Catholic University of America
 - Vladimir Ivantchenko, CERN
 - Sergio Lo Meo, INFN & ENEA
 - Mircho Rodosov, Bulgarian Academy of Sciences

Summary

- DD4hep is a powerful toolkit for detector geometry
 - Fully featured
 - Committed to years of support and further innovation
 - Development team very **responsive** to user needs
- CMS adoption of DD4hep is a **success** story for community-supported software
 - DD4hep supports **highly complex geometry** of CMS detector
 - Migration process **improved** both CMS software and DD4hep itself
- **Community-supported** toolkits provide major benefits to HEP

Backup

Migration Challenges (1)

- TGeo used by DD4hep not thread-safe
 - ROOT fix made it thread-safe
- DD4hep required enhancement to become compatible with Geant 10.4
- Special shapes needed by CMS (cut tube, pseudo-trapezoid, and truncated tube)
 - DD4hep team added these shapes
- Incorrect polycone shapes in XML files have to be fixed
- Old, obscure code difficult to migrate and test

Migration Challenges (2)

- Reflection rotations used by CMS for sub-detectors with two mirror-image sides (left-handed coordinate system)
 - DD4hep implemented reflection rotations
- CMS uses both Geant4 and ROOT unit conventions (mm = 1 vs. cm = 1)
 - DD4hep enhanced to allow selection of units convention
- CMS DD allows reference to undefined geometric objects in XML
 - DD4hep requires all objects be defined before being referenced
 - CMS code required enhancement to safely process legacy XML files with undefined object references
