Introduction

Brief history of EVE and Fireworks

- EVE development started in 2005 for ALICE
 - Split into ROOT-EVE and AliRoot-AliEve in 2007
 - Available as ROOT package graf3d/eve
 - *ROOT OpenGL interface was co-developed to support advanced EVE features*
- CMS chose EVE for physics-analysis event display in 2007
 - Prototype development 2008 / 09
 - Intense 5-developer effort in 2010 / 11
 - Full CMSSW support, geometry visualization, detailed views of all RECO objects
 - Faithful representation of EDM objects - what you see is what analysis algorithms see, too!
- Both EVE and Fireworks essentially in maintenance mode since 2011

Usage of EVE beyond ALICE and CMS:

- Belle2, HyperK, ILC, JUNO, NA-62, T2K
- Several smaller experiments in neutrino, nuclear, and medical physics

Motivation for EVE-7 & FireworksWeb

- **EVE is 15 years old**, ROOT-GL even older
 - Despite (or is it *Because of?*) all the progress, supporting native OpenGL still isn't easy.
 - OSX support is getting harder with every release.
 - SLC 6 / CentOS 7 ... our OSes are lagging years behind desktop versions.
 - People still run event display over ssh and this requires some deep tweaks lately.
- This causes trouble for both EVE in general and for Fireworks.
- **OpenGL is getting replaced with Vulkan** over the next couple of years.
 - Implementing a low-level rendering engine was a good choice 20 years ago.
 - Modern rendering engines completely insulate application from the low-level graphics.
- **ROOT-7 is replacing native GUI & graphics with web browser front-end.**
 - EVE has to either grow along or die ...

CMS has committed to support development of EVE-7 and FireworksWeb.

EVE-7 and FireworksWeb

Project outline

- Mission statement: *Rewrite EVE and Fireworks for LHC Run 3 and beyond.*
 - Keep most of EVE functionality in place while modernizing the code
 - Move some functionality from Fireworks into new EVE-7:
 - Physics data: collections, items, item filtering, and table views - possible because of Cling and C++ lambdas
 - Geometry browser
- Development Focus / Driver: **FireworksWeb prototype!**
 - First production release before Run 3.
 - Support at least the physics-analysis / event-scanning use case.
- Keep all advanced features, including:
 - Simultaneous (multiple) selection across physics items in table and graphical views
 - Non-linear projections (RPhi and RhoZ views with fish-eye blowup of vertex region)
 - Window management -- group views into independent top-level windows
 - Visualization of digits
 - Calorimeter visualization including Fireworks lego view
- Performance considerations
 - Optimize network traffic, data representations and workload on server and client

Components

- **Server / core: C++**
 - REveManager is the entry point holding hierarchy of Scenes / Directories of EVE objects
 - EVE objects support *streaming into JSON + binary data* for rendering
 - Graphical view & table configuration, selection, etc. are all implemented as EVE objects
 - *Client commands are C++ calls* on EVE elements *executed via Cling*
 - Data served through RWebWindow and ROOT's built-in civetweb web server
- **Client side: JavaScript**
 - **JSRoot**: initialization, colors, some 3D primitives & attributes, integration of OpenUI5
 - In the future also tree browser, file dialogs and geometry viewer
 - **OpenUI5**, the standard Web-GUI for ROOT
 - **Three.js**: 3D rendering

Server-Client communication

- Existence of **C++ server is crucial** for the main goal of EVE-7 & Fireworks: To visualize **exactly the same data** as is seen by **analysis / reconstruction algorithms**.
 - Allow users to use C++ expressions that call functions on actual physics data objects to:
 - set up filter expressions on physics objects, and
 - display correct values in table views, even for non-trivial expressions specified at runtime.
- Communication is **bidirectional and stateful** → **WebSocket** protocol is used.
- **Multiple client connections** are supported:
 - This is required to be able to show different views in different browser tabs / windows.
 - Each client subscribes only to views that are being shown in its window.
 - Selection and highlight are synchronized across all clients.
 - Likewise, **multiple users** can connect to the same server and view the same event.
- Full object data is sent only when a new event is loaded.
 - Within an event, only objects that get changed as a result of user actions are streamed.
 - Payload for event with 1,000 tracks (3D + 2 projected views) is O(1MB) spread over 6 messages

Status as of Nov. 2019

- **Prototype & technology demo**

- Testing of various aspects, including performance, server / client communication over WAN
- Will require (quite) some cleanup / restructuring before production release

- **Supported / implemented features & screenshots**

- **EVE-7:**

- **Visual objects:** pointsets, linesets, tracks, ellipsoid, jets, all TGeoShapes (including CSG)
- Support for **physics collections and physics items**
- Handling of **scene changes** (user interaction) and **destruction** (going to another event)
- **Selection and highlight** mechanism works **across graphical views** and different representations
- **Screenshots:** Cross view highlight & selection (pg. 12), Collections (pg. 13), Tables (pg. 14)

- **FireworksWeb:** uses all EVE-7 features and has most Fireworks concepts imported.

- **Plugin system for adding physics collections**
- **Collection editors** (color, visibility, and physics item filter)
- **Proxy builders** for tracks, PF candidates, jets, MET, electrons, vertices, muons, and CSC segments
- **Event navigation** through CMS EDM data file (but no event filtering yet)
- Uses **custom client GUI elements** for event info and event control
- **Screenshots:** Overview (pg. 15), Table with CMS reco::Track class (pg. 16)

Further work & Plans

Development plan

- **Short term** - clean up existing code:
 - ROOT 6.20 release in December (EVE-7 is in ROOT since v6.16, Jan. 2019)
 - FireworksWeb technology preview release by the end of 2019 (FWLite based tarball)
- **Plan for 2020:**
 - EVE-7 ready as replacement for EVE
 - Most functionality supported, including physics collection / item handling.
 - FireworksWeb functional for Run3
 - Support CMS physics data-analysis & event scanning / trigger studies
- **Beyond 2020:**
 - EVE-7: optimization & beautification, and user support!
 - FireworksWeb - advanced functionality:
 - Running from full CMSSW framework & editing of CMS algorithm parameters
 - CMS geometry browser
 - Optimization for Heavy Ion runs

Conclusion

- EVE-7 and FireworksWeb rewrites are well underway.
- FireworksWeb as the driving force for the migration had positive influence:
 - Focus on most important core elements required for technology investigation
 - Port high-level functionality from CMS codebase into ROOT
 - Provide a framework for building of comprehensive physics-analysis event displays
- The main motivation for moving physics data representation into EVE-7 was to share this with other experiments.
 - It proved to be extremely useful for CMS physics ...
 - ... and it will only make sense if other experiments actually use it.
- Early users / contributors are welcome at this point.
 - But beware there is another year of flux ahead.
