Experiment	$SU(3)$
average	$1.10 \pm 0.14\%$
	$0.10\% \pm 0.06\%$
	$0.04\% \pm 0.04\%$
	$0.26\% \pm 0.13\%$

SUMMARY

- Dark vector - are probed by current and near future experiments. The bounds can be easily recasted to a given model.
- Current PrimEx like experiment can probed unexplored parameter space of ALP.
- Hadronic rates of ALP and vector can be estimated in a data-driven methods based on e^+e^- data.

BACKUP SLIDES

DARK PHOTON SIGNAL

differential relation:

$$\frac{d\sigma_{pp \rightarrow X A' \rightarrow X \mu^+ \mu^-}}{d\sigma_{pp \rightarrow X \gamma^* \rightarrow X \mu^+ \mu^-}} = \epsilon^4 \frac{m_{\mu\mu}^4}{(m_{\mu\mu}^2 - m_{A'}^2)^2 + \Gamma_{A'}^2 m_{A'}^2}$$

per mass bin:

$$\frac{S}{B_{\text{EM}}} \approx \epsilon^4 \frac{\pi}{8} \frac{m_{A'}^2}{\Gamma_{A'} \sigma_{m_{\mu\mu}}} \approx \frac{3\pi}{8} \frac{m_{A'}}{\sigma_{m_{\mu\mu}}} \frac{\epsilon^2}{\alpha_{\text{EM}} (N_\ell + \mathcal{R}_\mu)}$$

$$\frac{\Gamma_{A'}}{m_{A'}} \approx \frac{\epsilon^2 \alpha_{\text{EM}}}{3} (N_\ell + \mathcal{R}_\mu)$$

number of leptons with
mass below $m_{A'}/2$

$$\frac{\sigma_{e^+e^- \rightarrow \text{hadrons}}}{\sigma_{e^+e^- \rightarrow \mu^+\mu^-}}$$

DARK PHOTON AT LHCb

- real time data analysis (trigger-less) for Run 3
- particle identification
- muons detection:
 - dimuon invariant mass ($m_{\mu\mu}$) resolution:
 - 4 MeV, $m_{\mu\mu} < 1$ GeV
 - 0.4% $m_{\mu\mu}$, $m_{\mu\mu} > 1$ GeV
 - time resolution: $\sigma_{\tau} \sim 50$ fs (almost constant in proper lifetime)

DARK PHOTON AT LHCb

VELO
(vertex locator)

SIGNAL AND BACKGROUNDS

prompt
short lifetime
larger ϵ

SIGNAL AND BACKGROUNDS

prompt
short lifetime
larger ϵ

“good” backgrounds

$$S_{A'} \propto B_{EM}$$

SIGNAL AND BACKGROUNDS

prompt
short lifetime
larger ϵ

“good” backgrounds “bad”

$$S_{A'} \propto B_{EM}$$

$$S_{A'} \not\propto B_{EM}$$

misidentified hadrons
(pions, kaons)

SIGNAL AND BACKGROUNDS

prompt
short lifetime
larger ϵ

“good” backgrounds

“bad”

$$S_{A'} \propto B_{EM}$$

$$S_{A'} \not\propto B_{EM}$$

meson decays
Drell-Yan

misidentified hadrons
(pions, kaons)

displaced
long lifetime
smaller ϵ

backgrounds
heavy flavor (b, c) decays

PROMPT BACKGROUNDS

- misidentified pions:
 - $B^{\pi\pi}$ - two pions are misidentified $\epsilon_{\pi} \approx 10^{-3}$
 - $B^{\pi\mu}$ - one pion is misidentified and one real muon
- B_{BH} - Bethe-Heitler background, subdominant due to small photon luminosity function

$$B_{\text{prompt}} = \underbrace{B_M + B_{\text{FSR}} + B_{\text{DY}}}_{B_{\text{EM}}} + \underbrace{B_{\text{misID}}^{\pi\pi} + B_{\text{misID}}^{\pi\mu}}_{B_{\text{misID}}}$$

“good”

scales as signal

“bad”

does not
scale as signal

PROMPT BACKGROUNDS

subtracting fake pions by using the same-sign sample:

$$n_{\pm\pm}^{\pi\pi} = \frac{n_{\pm}^{\pi}(n_{\pm}^{\pi} - 1)}{2}$$

$$n_{+-}^{\pi\pi} \approx 2\sqrt{n_{++}^{\pi\pi}n_{--}^{\pi\pi}} \approx n_{++}^{\pi\pi} + n_{--}^{\pi\pi}$$

$$n_{+-}^{\pi\pi} = n_{+}^{\pi}n_{-}^{\pi}$$

number of same(opposite)
sign events per bin

generalize to all bins and for one fake:

$$N_{+-}^{\pi\pi} \approx N_{++}^{\pi\pi} + N_{--}^{\pi\pi}$$

$$N_{+-}^{\pi\mu} \approx N_{++}^{\pi\mu} + N_{--}^{\pi\mu}$$

$$B_{\text{misID}}^{\pi\pi} + B_{\text{misID}}^{\pi\mu} \approx N_{++} + N_{--}$$

DISPLACED BACKGROUNDS

- **pre-module:**
 - main backgrounds: $b \rightarrow c \mu^\pm X, c \rightarrow \mu^\pm Y$
 - 10000 background events per mass bin
- **post-module:**
 - mostly material interactions, rescaled from $K_S \rightarrow \mu^+ \mu^-$ search
 - 25 background events pre mass bin
- backgrounds from misidentifications are subdominants

DISPLACED RECAST

$$\epsilon(\tau) = e^{-\tilde{t}_0/\tau} - e^{-\tilde{t}_1/\tau}$$

$$\tilde{t}_1 = \tilde{t}_0(1 + L_{\text{dec}}/L_{\text{sh}})$$
