

# **Physics at LHC:** ***SUperSYmmetry***

*Pedrame Bargassa*

LIP 22/04/2019

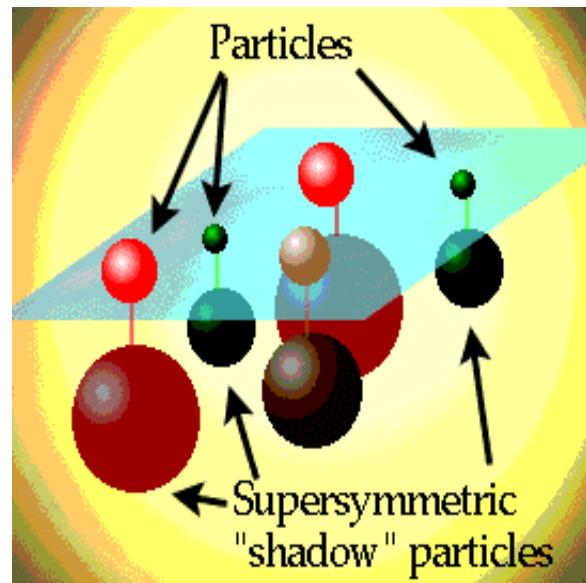

# Outline

- *SUperSYmmetry: Brief introduction & Motivations*
- *Reminder of Standard Model (SM) Lagrangian*
- *SUSY phenomenology: Deeper look*
  - “Constructing” the *SUSY Lagrangian*
  - *Different sectors of MSSM:*
    - *Squark & Slepton*
    - *Chargino*
    - *Neutralino*
    - *Higgs*

## Advised readings:

- “*SUSY & Such*” S. Dawson, arxiv:hep-ph/9612229v2
- “*A supersymmetry primer*” S. P. Martin, arxiv:hep-ph/9709356

## ***Brief introduction & Motivations***

# Supersymmetry: Introduction words

“Generalize” the spin of known fields

**SUperSYmmetry :**      spin particle  $\frac{1}{2} \leftrightarrow$  spin partner 0  
 spin particle 1  $\leftrightarrow$  spin partner  $\frac{1}{2}$

Names		spin 0	spin 1/2
squarks, quarks $(\times 3$ families)	$Q$	$(\tilde{u}_L \quad \tilde{d}_L)$	$(u_L \quad d_L)$
	$\bar{u}$	$\tilde{u}_R^*$	$u_R^\dagger$
	$\bar{d}$	$\tilde{d}_R^*$	$d_R^\dagger$
sleptons, leptons $(\times 3$ families)	$L$	$(\tilde{\nu} \quad \tilde{e}_L)$	$(\nu \quad e_L)$
	$\bar{e}$	$\tilde{e}_R^*$	$e_R^\dagger$
Higgs, higgsinos	$H_u$	$(H_u^+ \quad H_u^0)$	$(\tilde{H}_u^+ \quad \tilde{H}_u^0)$
	$H_d$	$(H_d^0 \quad H_d^-)$	$(\tilde{H}_d^0 \quad \tilde{H}_d^-)$

Names	spin 1/2	spin 1
gluino, gluon	$\tilde{g}$	$g$
winos, W bosons	$\widetilde{W}^\pm \quad \widetilde{W}^0$	$W^\pm \quad W^0$
bino, B boson	$\tilde{B}^0$	$B^0$

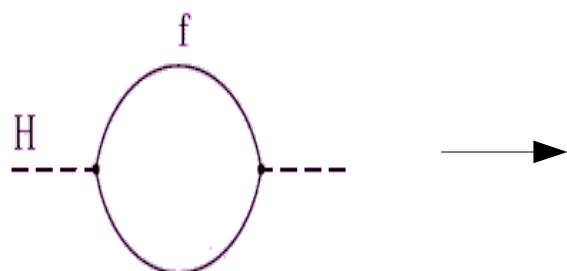

Observed SUSY particles with same mass  
than Standard-Model partners ? No !

**SUSY : A broken symmetry !**  
**Physical sParticles:**  
**Mixture of super-partners**

- Charginos ( $\chi^\pm$ ) / Neutralinos ( $\chi^0$ ) :  
Bino/Wino  $\leftrightarrow$  Higgs (charged/neutral)
- Squarks, Sleptons : Mixture of  $f_L \leftrightarrow f_R$

# Supersymmetry: The natural cure of Hierarchy problem

- Discovery of a Higgs Boson:
  - $m_H = 125 \text{ GeV}/c^2$
- Consider Higgs mass correction from fermionic loop:

A Feynman diagram showing a fermion loop (a circle) with an incoming Higgs boson (dashed line) and an outgoing fermion (solid line labeled f). An arrow points to the right, leading to the formula for the mass correction.

$$\Delta m_H^2 = \frac{\lambda_f^2}{16\pi^2} \cdot [-2\Lambda_{UV}^2 + \dots]$$

$\Lambda_{UV}$ : Energy-scale at which new physics alters the Standard-Model (momentum cut-off regulating the loop-integral)

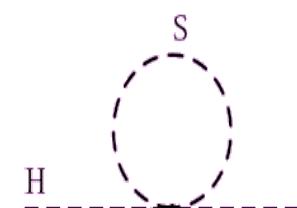

If  $\Lambda_{UV} \sim M_P \rightarrow \Delta m_H^2 \sim O(10^{30})$  larger than  $m_H$  !!!

And all Standard-Model masses indirectly sensitive to  $\Lambda_{UV}$  !!!

A Feynman diagram showing a fermion loop with an incoming Higgs boson (dashed line) and an outgoing fermion (solid line labeled f). A supersymmetric partner loop (dashed line labeled S) is shown inside the fermion loop, indicating cancellation of quadratic divergence.

$$\Delta m_H^2 = \frac{\lambda_f^2}{16\pi^2} \cdot [-2\Lambda_{UV}^2 + \dots]$$

A Feynman diagram showing a supersymmetric partner loop (dashed line labeled S) with an incoming Higgs boson (dashed line) and an outgoing fermion (solid line). This loop is part of a larger loop structure, illustrating how it cancels the quadratic divergence of the fermion loop.

$$\Delta m_H^2 = \frac{\lambda_s^2}{16\pi^2} \cdot [\Lambda_{UV}^2 - \dots]$$

$\Delta m_H^2$  quadratic divergence cancelled :

**Hierarchy problem naturally solved !**

# Supersymmetry & Coupling constants

In Gauge theories :

Predict coupling constants at a scale  $Q$  once we measured them at another:

$$1/\alpha_i(Q) = 1/\alpha_i(M_Z) + (b_i/2) \log[M_Z/Q]$$

$b_i$ : Function of  $N_g (=3)$  and  $N_H$  (Number of Higgs doublets)

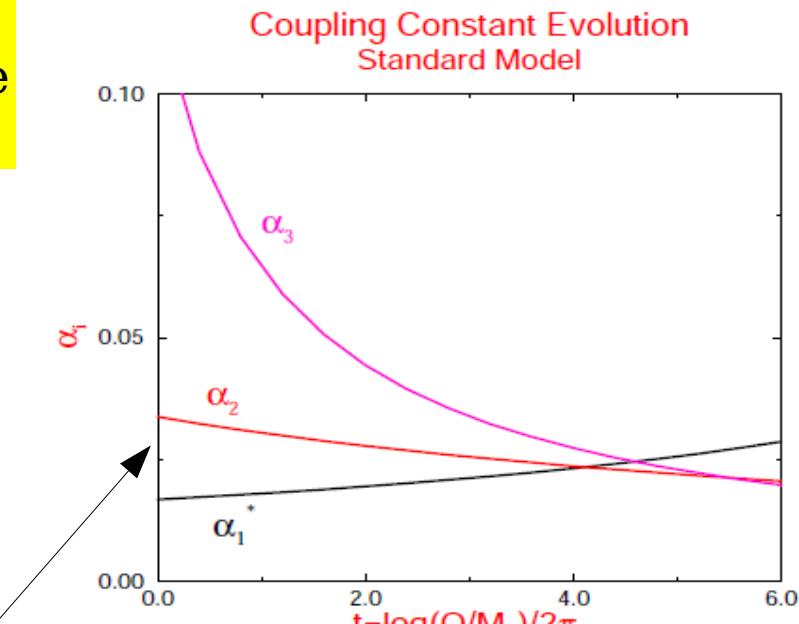

**In Standard-Model** :  $N_H = 1$

->  $b_i$ 's such that ...

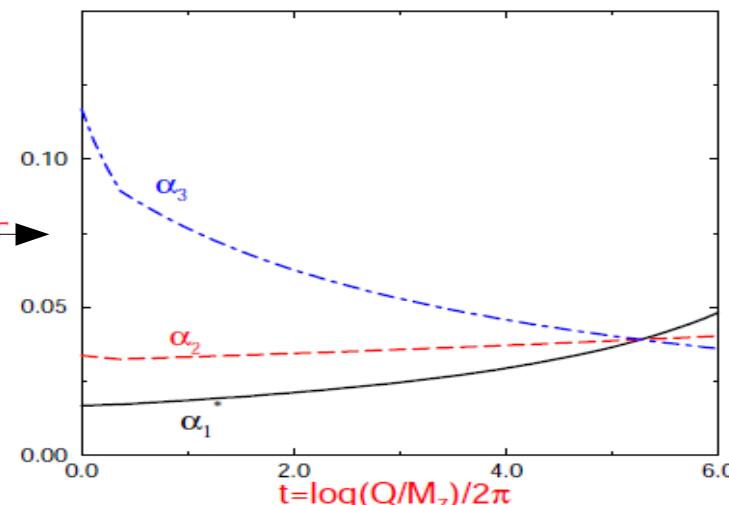

**In SUSY**:  $N_H = 2$  + New particles

contributing to a different evolution of coupling constants

->  $b_i$ 's such that !

Coupling Constant Evolution  
Standard Model

# Supersymmetry & Dark Matter

Most general SUSY lagrangian allows interactions leading to Baryon- & Lepton-number violation !

**Now if sParticles were to exist at TeV scale:**

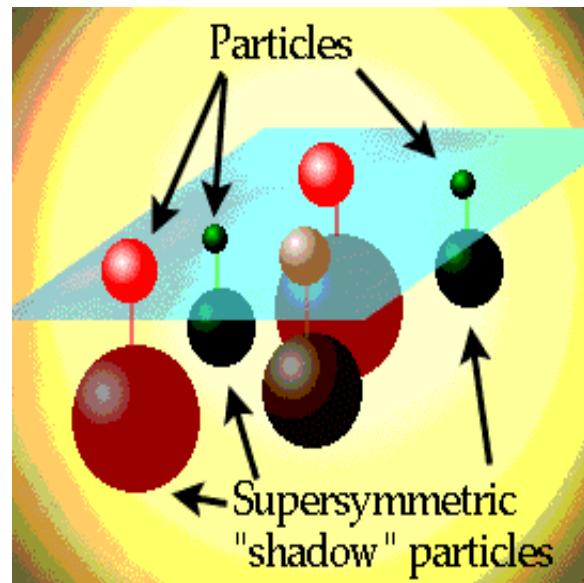

Such interactions very seriously restricted by experimental observation !

In SUSY:  $N_{B,L}$  conservation *can* be “protected” by new symmetry  $R_p$ :

- **Eigenvalue:  $(-1)^{3(B-L)+s}$** 
  - +1 / -1 for SM / SUSY particles
- **If  $R_p$  conserved: Lightest Supersymmetric Particle (LSP) is stable**  
In most SUSY scenarios, LSP is either:
  - The lightest neutralino  $\tilde{\chi}^0$  (mixture of neutral Higgsinos / Bino / Wino)
  - Scalar neutrinos
- ...In all cases a weakly interacting neutral particle

**SUSY can have a natural candidate for the observed Cold Dark Matter** :  $\sim 25\%$  of mass of universe

## *Revisiting SM Lagrangian*

# SM Lagrangian

Let's put the QCD part aside & have a look at the EW part only

$$L_{EW} = L_{\text{free+interaction}} + L_{\text{gauge}} + L_{\text{higgs}} + L_{\text{yukawa}}$$

## SM Lagrangian: Free & Interaction parts

$$L_{\text{free+interaction}} = \sum_f i [\bar{\psi}_f^L \gamma^\mu D_\mu^L \psi_f^L + \bar{\psi}_f^R \gamma^\mu D_\mu^R \psi_f^R]$$

→  $\psi_f^{L,R}$ : Left and Right fermion, CC, Dirac spinors

→ Gauge-invariant derivatives:

$$\begin{aligned} D_\mu^L &= \delta_\mu - i g (\tau_a/2) W_a^\mu - i g' (Y_L/2) B_\mu \\ D_\mu^R &= \delta_\mu - i g' (Y_R/2) B_\mu \end{aligned}$$

→  $g, g'$ : Weak-isospin & -hypercharge couplings

→  $W_a^\mu, B_\mu$ : Weak-isospin & -hypercharge fields

→  $\tau_a, Y_{L,R}$ : Weak-isospin & -hypercharge quantum numbers, matrices

## SM Lagrangian: The gauge part

$$L_{\text{gauge}} = -(1/4) W^a_{\mu\nu} W^{a\mu\nu} - (1/4) B_{\mu\nu} B^{\mu\nu}$$

→ Gauge-invariant Weak-isospin & -hypercharge fields:

$$W^a_{\mu\nu} = \delta_\mu^\nu W^a_\nu - \delta_\nu^\mu W^a_\nu + g \epsilon_{abc} W^b_\mu W^c_\nu$$

$$B_{\mu\nu} = \delta_\mu^\nu B_\nu - \delta_\nu^\mu B_\nu$$

2<sup>nd</sup> term of  $W^a_{\mu\nu}$ : Self-interacting character of Weak-isospin interaction → *This is the term allowing tri-boson couplings in SM*

A similar term exists in QCD sector of SM: QCD is also non-abelian → Allows self-coupling

## SM Lagrangian: The Higgs part

$$L_{\text{Higgs}} = (D_\mu \phi)^+ (D^\mu \phi) - V(\phi)$$

$D_\mu$  : Same gauge-invariant derivatives as before

→ 1<sup>st</sup> term: Higgs↔Boson interaction:

Gives Boson masses

Gives Higgs↔Boson couplings

→  $V(\phi)$ : Pure Higgs interaction:

$$\text{Mass: } m_H = \sqrt{-2\mu^2} = \sqrt{2\lambda v^2}$$

Coupling: Calculate :-D

The lagrangian has to be SU(2)xU(1) invariant

→ 4 scalar real fields:  $\phi = (\phi^+, \phi^0)$

$$\phi^+ = (1/\sqrt{2})(\phi_1 + i\phi_2)$$

$$\phi^0 = (1/\sqrt{2})(\phi_3 + i\phi_4)$$

## SM Lagrangian: Yukawa

$$L_{\text{yukawa}} = -G_d (\bar{u}, \bar{d})_L (\phi^+, \phi^0) d_R - G_u (\bar{u}, \bar{d})_L (-\bar{\phi}^0, \phi^-) u_R + \text{hermitian-conjugate}$$

(u,d): Up & Down doublets of quarks / leptons

Once Higgs sector is EW-broken:

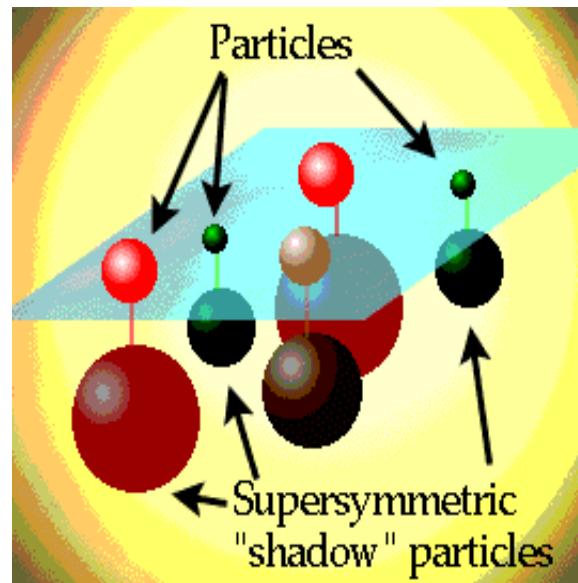

$\phi = (1/\sqrt{2})(0, v + H)$  → “Confers” mass to fermions:

$$L_{\text{yukawa}} = -m_d \bar{d}_L d_R (1 + H/v) - m_u \bar{u}_L u_R (1 + H/v)$$

because:  $m_f = G_f v/\sqrt{2}$

For neutrinos:  $m = G_\nu v/\sqrt{2} \sim 0$

## *“Constructing” the SUSY Lagrangian*

# MSSM: Writing the Lagrangian

## **Recipe to build the particle content and Lagrangian:**

- Each SM fermion  $f$  has 2 chiral superpartners:  $f_L$  &  $f_R$
  - SM fermions and SUSY sfermions are regrouped in **superfields**

$Q = \begin{pmatrix} u \\ d \end{pmatrix}_L$	$\longrightarrow$	$\tilde{Q} = \begin{pmatrix} \tilde{u}_L \\ \tilde{d}_L \end{pmatrix}$	$\overline{u}_R$	$\tilde{u}_R^*$
$L = \begin{pmatrix} \nu \\ e \end{pmatrix}_L$	$\longrightarrow$	$\tilde{L} = \begin{pmatrix} \tilde{\nu}_L \\ \tilde{e}_L \end{pmatrix}$	$\overline{e}_R$	$\tilde{e}_R^*$

- **Gauge superfields:** “Simply” containing the SM gauge fields and their SUSY partners
  - Gauge superfields: Respecting the  $SU(3) \times SU_L(2) \times U(1)$

# MSSM: Writing the Lagrangian

**Superfields of Gauge & Matter, by definition, respect the gauge symmetries extended from the SM**

Superfield	SU(3)	$SU(2)_L$	$U(1)_Y$	Particle Content
$\hat{Q}$	3	2	$\frac{1}{6}$	$(u_L, d_L), (\tilde{u}_L, \tilde{d}_L)$
$\hat{U}^c$	$\bar{3}$	1	$-\frac{2}{3}$	$\bar{u}_R, \tilde{u}_R^*$
$\hat{D}^c$	$\bar{3}$	1	$\frac{1}{3}$	$\bar{d}_R, \tilde{d}_R^*$
$\hat{L}$	1	2	$-\frac{1}{2}$	$(\nu_L, e_L), (\tilde{\nu}_L, \tilde{e}_L)$
$\hat{E}^c$	1	1	1	$\bar{e}_R, \tilde{e}_R^*$
$\hat{H}_1$	1	2	$-\frac{1}{2}$	$(H_1, \tilde{h}_1)$
$\hat{H}_2$	1	2	$\frac{1}{2}$	$(H_2, \tilde{h}_2)$

Superfield	SU(3)	$SU(2)_L$	$U(1)_Y$	Particle Content
$\hat{G}^a$	8	1	0	$g, \tilde{g}$
$\hat{W}^i$	1	3	0	$W_i, \tilde{\omega}_i$
$\hat{B}$	1	1	0	$B, \tilde{b}$

# MSSM: Writing the Lagrangian

## The interaction part:

$$\mathcal{L}_{int} = -\sqrt{2} \sum_{i,A} g_A [S_i^* T^A \bar{\psi}_{iL} \lambda_A + h.c.] - \frac{1}{2} \sum_A \left( \sum_i g_A S_i^* T^A S_i \right)^2$$

- Interaction-specific quantum number
- $S_i$ : Scalar fields: Squarks & Sleptons
- $\psi_i$ : Higgsinos
- $\lambda_A$ : Gauge fermions

**The gauge invariant derivative part: Same as introduced in SM, but generalized to superfields**

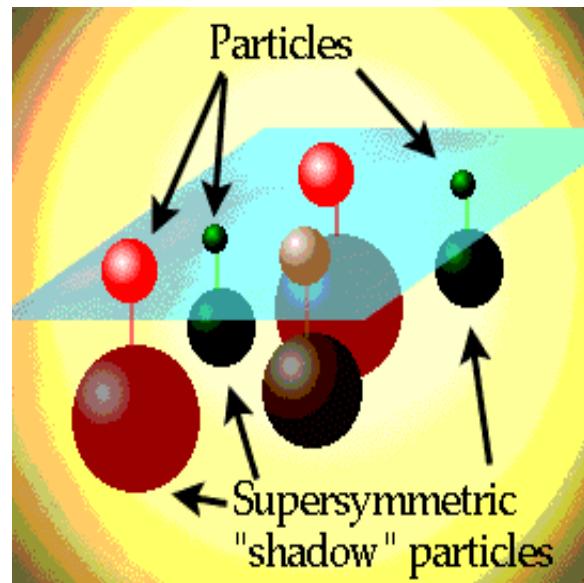

## The kinetic part:

$$\begin{aligned} \mathcal{L}_{KE} = & \sum_i \left\{ (D_\mu S_i^*) (D^\mu S_i) + i \bar{\psi}_i D \psi_i \right\} \\ & + \sum_A \left\{ -\frac{1}{4} F_{\mu\nu}^A F^{\mu\nu A} + \frac{i}{2} [\bar{\lambda}_A] D [\lambda_A] \right\} \end{aligned}$$

# MSSM: SM $\leftrightarrow$ MSSM correspondance

Fermion	Scalar	Gauge field
<u>SM</u> $i \bar{f} \gamma^\mu D_\mu f +$	$(D_\mu \phi)^+ (D^\mu \phi)$ SM: Higgs	$- (1/4) F_{\mu\nu} F^{\mu\nu}$
<u>MSSM</u> (includes what is above)  $i \bar{\psi} \gamma^\mu D_\mu \psi +$ MSSM: Higgsinos $+ (i/2) \bar{\lambda}_A \gamma^\mu D_\mu \lambda_A$ Gauge fermions	$(D_\mu S_i)^+ (D^\mu S_i)$ Squarks & Sleptons	$- (1/4) F_{\mu\nu} F^{\mu\nu}$ Same as above

## ***SUSY: Let's minimally break it: Broken & effective MSSM***

# SUSY breaking

## **How is it broken ? We don't know... did not discover it (yet)...**

How we *think* it's broken: Models/Implications by/for the theorists/experimentalists

### mSUGRA

Spontaneous Super-Gravity breaking: **More constrained → 5 parameters** @ breaking scale -> RGEs → Our mass spectrum

- $m_0$ : Scalar mass
- $m_{1/2}$ : Fermion mass
- $\mu$ : Higgs parameter ( $\mu H_1 H_2$ )
- $A$ : Tri-linear squark/slepton mixing term
- $\tan\beta = \langle H_2^0 \rangle / \langle H_1^0 \rangle$

### MSSM

Parametrizing our ignorance of SUSY breaking, i.e. no hypothesis: **Un-constrained → 124 parameters**

- $\tan\beta / \mu / M_A$  (pseudoscalar Higgs boson mass)
- $M_{L1,2,3}$ : Controls slepton masses
- $M_{Q1,2,3}$ : Controls squark masses
- $M_{1,2}$ : Controls neutralino/chargino sectors
- ...

This is the most general Lagrangian we can write, hence the large number of unknowns: Only the spin hypothesis has been made

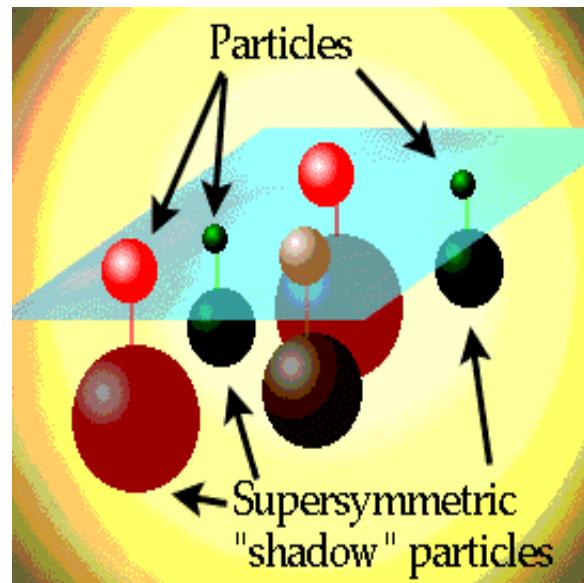

# MSSM: Effective Lagrangian

- › We don't know how SUSY is broken, but can write the **most general broken effective Lagrangian**
- › Soft: The breaking of the symmetry is taken care of by introducing "soft" mass terms for scalars & gauginos: Soft because no re-introduction of quadratic divergence
- › Maximal dimension of soft operators:  $\leq 3 \rightarrow$  Mass terms, **Bilinear** & **Trilinear** terms

$$\begin{aligned}
-\mathcal{L}_{soft} = & \boxed{m_1^2 |H_1|^2 + m_2^2 |H_2|^2} - \boxed{B\mu\epsilon_{ij}(H_1^i H_2^j + \text{h.c.})} + \boxed{\tilde{M}_Q^2(\tilde{u}_L^* \tilde{u}_L + \tilde{d}_L^* \tilde{d}_L)} \\
& + \boxed{\tilde{M}_u^2 \tilde{u}_R^* \tilde{u}_R + \tilde{M}_d^2 \tilde{d}_R^* \tilde{d}_R + \tilde{M}_L^2(\tilde{e}_L^* \tilde{e}_L + \tilde{\nu}_L^* \tilde{\nu}_L) + \tilde{M}_e^2 \tilde{e}_R^* \tilde{e}_R} \\
& + \frac{1}{2} \boxed{[M_3 \bar{g} \tilde{g} + M_2 \bar{\omega}_i \tilde{\omega}_i + M_1 \bar{b} \tilde{b}]} + \frac{g}{\sqrt{2}M_W} \epsilon_{ij} \boxed{\frac{M_d}{\cos\beta} A_d H_1^i \tilde{Q}^j \tilde{d}_R^*} \\
& + \boxed{\frac{M_u}{\sin\beta} A_u H_2^j \tilde{Q}^i \tilde{u}_R^* + \frac{M_e}{\cos\beta} A_e H_1^i \tilde{L}^j \tilde{e}_R^* + \text{h.c.}} .
\end{aligned}$$

**Specificity of SUSY:** Writing the most general Lagrangian, generalizing the spins of fields, SUCH that quadratic divergences are always shut down

## ***Squark & Slepton sector***

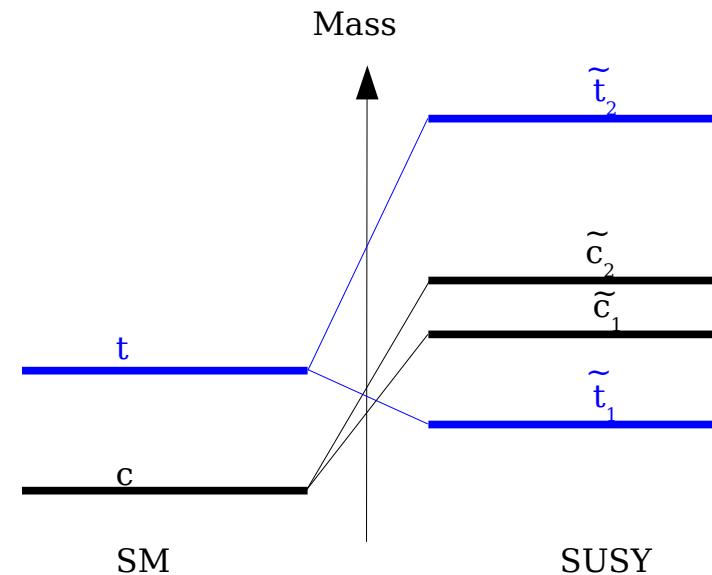

# MSSM: Squark & Slepton sector

**Physical states are 2 scalar mass-eigenstates: Mixtures of left- & -right chiral superpartners (scalars) of SM quark and leptons**

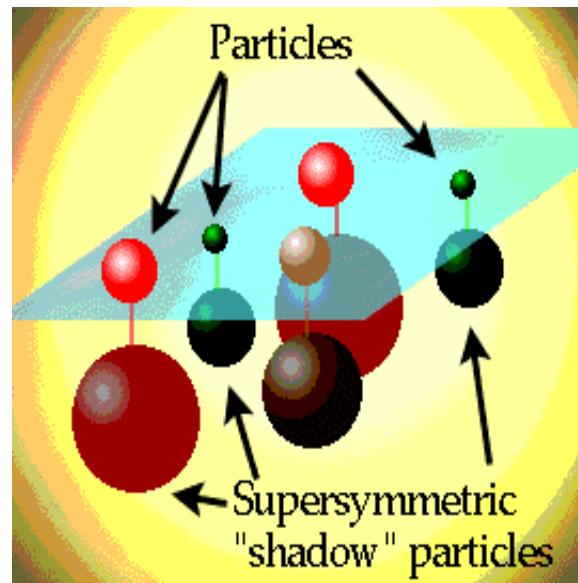

Let's pick-up example of the top sector: If  $[f_L - f_R]$  chiral basis:

$$\tilde{M}_t^2 = \begin{pmatrix} \tilde{M}_Q^2 + M_T^2 + M_Z^2 \left( \frac{1}{2} - \frac{2}{3} \sin^2 \theta_W \right) \cos 2\beta & M_T(A_T + \mu \cot \beta) \\ M_T(A_T + \mu \cot \beta) & \tilde{M}_U^2 + M_T^2 + \frac{2}{3} M_Z^2 \sin^2 \theta_W \cos 2\beta \end{pmatrix}$$

- $\tilde{M}_Q$ : Left squark mass
- $\tilde{M}_U$ : Right squark mass
- $A_T$ : Trilinear coupling specific to the top sector
- $M_Q = M_T$ : Mass of the SM particle
- $\mu$ : Higgs (bilinear) mixing parameter
- $\beta$ : Higgs vev-specific parameter (see in a couple of slides): **Plays a role in the mixing**

## *Chargino sector*

## MSSM: Chargino sector

**Physical states are 2 fermionic mass-eigenstates: Mixtures of charged winos and charged higgsinos, which are SUSY eigenstates**

In the charged [wino - higgsino] basis:

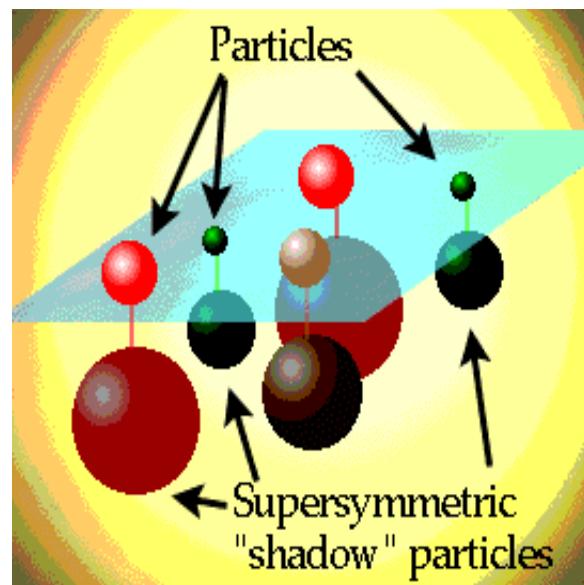

$$M_{\tilde{\chi}^\pm} = \begin{pmatrix} M_2 & \sqrt{2}M_W \sin \beta \\ \sqrt{2}M_W \cos \beta & -\mu \end{pmatrix}$$

- $M_2$ : Mass of the wino
- $\mu$ : Higgs (bilinear) mixing parameter

- The more  $M_2 \gg 1$ : The more the charginos are wino-like

- Comments:
  - The more  $\mu \gg 1$ : The more the charginos are higgsino-like
  - $\beta$ : Not playing a role in mixing

## ***Neutralino sector***

## MSSM: Neutralino sector

**Physical states are 4 fermionic mass-eigenstates: Mixtures of neutral winos  $w^0$ , bino  $b$ , and 2 neutral higgsinos, which are SUSY eigenstates**

In the neutral  $[b - w^0 - h^0_1 - h^0_2]$  basis:

$$M_{\tilde{\chi}_i^0} = \begin{pmatrix} M_1 & 0 & -M_Z \cos \beta \sin \theta_W & M_Z \sin \beta \sin \theta_W \\ 0 & M_2 & M_Z \cos \beta \cos \theta_W & -M_Z \sin \beta \cos \theta_W \\ -M_Z \cos \beta \sin \theta_W & M_Z \cos \beta \sin \theta_W & 0 & \mu \\ M_Z \sin \beta \sin \theta_W & -M_Z \sin \beta \cos \theta_W & \mu & 0 \end{pmatrix}$$

- $M_1$ : Mass of the bino
- $M_2$ : Mass of the wino
- $\mu$ : Higgs (bilinear) mixing parameter

Exercise: Qualitatively gauge the influence of each parameters in the mass-matrix above on the “type” of neutralinos

# EXERCISES

1/ Install the SuSpect software on your computer: This one of the only SUSY spectrum calculators with parametrized MSSM (pMSSM) parameters as input: You don't have 124, but 27 parameters to play with ;-)

2/ Just play with different parameters and follow evolution of the generated masses

2i) What are the most sensitive parameters for different types of particles ?

2ii) Once you get an idea for 2i): For a set of frozen parameters, produce plots showing evolution of the physical masses, say , as function of pMSSM parameters

For 2i) & 2ii), let's pick-up:

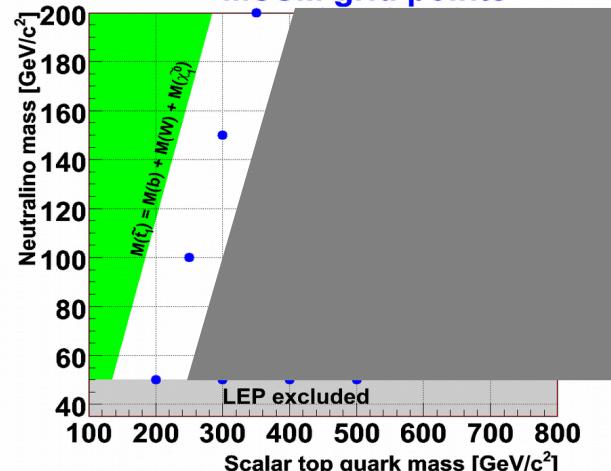

- The lightest neutralino
- The chargino
- The lightest stop and stau
- The highest Higgs

3/ Once your fingers are well warmed-up with pMSSM, produce the points on the following page :-D

# Stop decays: Different diagrams for different domains

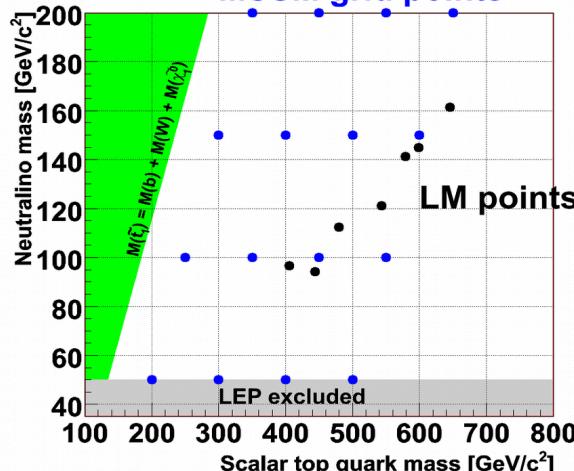

$$\tilde{t}_1 \rightarrow b W^+ \tilde{\chi}_1^0$$

MSSM grid points

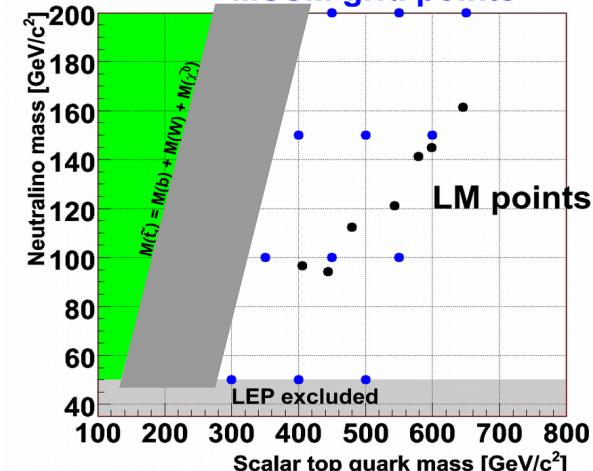

$$\tilde{t}_1 \rightarrow b \tilde{\chi}_1^+$$

MSSM grid points

$$\tilde{t}_1 \rightarrow t \tilde{\chi}_1^0$$

MSSM grid points

## Conditions:

$$b + W + \tilde{\chi}_1^0 < \tilde{t}_1$$

$$\tilde{t}_1 < t + \tilde{\chi}_1^0 :$$

$$\text{Close } \tilde{t}_1 \rightarrow t + \tilde{\chi}_1^0$$

## “Dominance” conditions:

$$\tilde{t}_1 < \tilde{\chi}_1^+ + b :$$

Make  $\tilde{\chi}_1^+$  virtual

$$b + W + \tilde{\chi}_1^0 < \tilde{t}_1$$

$$W + \tilde{\chi}_1^0 < \tilde{\chi}_1^+ < \tilde{t}_1 - b$$

← Not exclusive: Will co-exist →

$$t + \tilde{\chi}_1^0 < \tilde{t}_1$$

$$t + \tilde{\chi}_1^0 < \tilde{\chi}_1^+ + b :$$

Privilege vs  $b \tilde{\chi}_1^+$
