

Future High Energy Linear Colliders

Louis Rinolfi

CERN

Hadrons versus leptons colliders

hadron collider => frontier of physics

- discovery machine
- quarks collisions
- not all nucleon energy available in collision
- huge background

lepton collider => precision physics

- study machine
- elementary particles collisions
- well defined CM energy
- polarization possible

Brief history of high energy linear colliders $e^+ e^-$

1985: **CLIC** = CERN Linear Collider => Compact Linear Collider

1989: **SLC = Stanford Linear Collider**
Start **operation** with the beam

1995: **Six linear colliders studies at high energy, in parallel:**

=> TESLA (1.3 GHz, superconducting, SC) DESY (Germany)

=> SBLC (3 GHz, normal conducting, NC) DESY (Germany)

=> NLC (11.4 GHz, normal conducting, NC) SLAC (California)

=> JLC (11.4 GHz, normal conducting, NC) KEK (Japan)

=> VLEPP (14 GHz, normal conducting, NC) Novosibirsk (Russia)

=> CLIC (30 GHz, normal conducting, NC) CERN (Switzerland)

2004: International Technology Recommendation Panel selects the Superconducting RF technology versus room temperature technology
=> ILC (International Linear Collider) based on TESLA technology

2019: **CLIC (12 GHz) and ILC (1.3 GHz) studies are ongoing**

Future high energy colliders as seen in 2000

LONGITUDINAL BEAM DYNAMICS

Application to synchrotron

CERN/PS 2000-008 (LP)

Course given at JUAS (Joint Universities Accelerator School) at Archamps (France)

January 2000

The milestones with a possible future scenario are given below:

1989: SLC first beam (50 GeV)

1989: LEP first beam (45 GeV)

1998: End of SLC (50 GeV with polarised electrons)

2000: End of LEP (104 GeV)

2005: LHC first beam p^+/p^+ (7 TeV) (approved in 1994)

2010: Linear Collider e^-/e^+ (up to 3 TeV) (?)

2030: Muons Collider μ^-/μ^+ (?)

Asian Linear Collider Workshop 2018

May 28 - June 1, 2018 Fukuoka International Congress Center Fukuoka, JAPAN

International Organizing Committee (IOC)

- Ties Behnke (DESY)
- James Brau (University of Oregon)
- Brajesh Choudhary (University of Delhi)
- Dmitri Denisov (FNAL)
- Lyn Evans (LCC)
- Keisuke Fujii (KEK)
- Juan Frazer (IFIC-Valencia)
- Jie Gao (IHEP)
- Christophe Grosjean (DESY)
- George W.S. Hou (National Taiwan University)
- Kiyotomo Kawagoe (Kyushu University, Chair)
- Sachio Komamiya (University of Tokyo)
- Lucie Linssen (CERN)
- Benno List (DESY)
- Shinichiro Michizono (KEK)
- Akiya Miyamoto (KEK)

Recent workshops on high energy linear colliders

CLICWEEK2019

Compact Linear Collider Workshop

January 21 - 25, 2019 @ CERN

Accelerator technology, high-gradient structures, and low-emittance beams

- Advanced radio frequency technologies: high-efficiency klystrons, pulse compressors, components, and accelerating structures
- Low emittance beams: beam dynamics, damping rings, beam delivery, instrumentation, alignment, stabilization
- Staged approach: from a 380 GeV Higgs/top factory to TeV energies

Detector technology and software

- Detector R&D: new prototype designs, simulation studies, and test-beam results for tracking detectors and calorimeters
- Software for detector geometry, simulation and reconstruction (DD4hep)
- Tracking and particle flow reconstruction
- Distributed data management and computing (iLCDirac)

Precision physics: Higgs, top, and BSM

- CLIC potential for precision measurements of the Higgs boson and top-quark properties, and the flavour sector
- Global interpretation using Standard Model effective field theory
- Signatures for direct discovery at CLIC, complementarity with indirect probes and hadron colliders

e^+e^- collisions at the energy frontier!

International Workshop on Future Linear Colliders LCWS2018

October 22-26, 2018

UNIVERSITY OF TEXAS  ARLINGTON

Basic Linear Collider

Reach the highest collision **energy**

Reach the highest **luminosity**

With a reduced power consumption and a minimum cost

BDS = Beam Delivery System

RTML = Return To Main Linac

Energy center of mass for linear colliders

Energy (center of mass) $E_{\text{cm}} = 2 F_{\text{fill}} L_{\text{linac}} G_{\text{RF}}$

MeV \swarrow \downarrow \searrow

m MV/m

F_{fill} = Filling factor of the Linac;

L_{linac} = Length of the linac;

G_{RF} = accelerating gradient

Luminosity

$$\text{Number of events} = \sigma_{\text{event}} \times \int L(t) dt$$

σ_{event} is the probability of producing a particular event

$\int L(t) dt$ is a measure of the total number of interactions with L the instantaneous luminosity

The unit of the cross-section (σ_{event}) is the barn ($1 \text{ barn} = 10^{-28} \text{ m}^2$)
 $\Rightarrow 1 \text{ fb} = 10^{-43} \text{ m}^2$

Basic expression for
luminosity

$$L = \frac{n_b N^+ N^- f_{\text{rep}}}{4 \pi \sigma_x \sigma_y}$$

Units: L is $\text{cm}^{-2} \text{ s}^{-1}$, f_{rep} is Hz, σ_x, σ_y are cm.

n_b = number of bunches; N = number of particles per bunch; σ_x, σ_y = rms transverse beam sizes

Re-write luminosity for linear colliders

$$L = \frac{n_b N^+ N^- f_r}{4 \pi \sigma_x \sigma_y}$$

$$\mathcal{L} \propto H_D \frac{N}{\sigma_x} N n_b f_r \frac{1}{\sigma_y}$$

Luminosity spectrum (Physics) Beam current (Power and RF limits, beam stability) Beam Quality (Many systems)

$$\mathcal{L} \propto \frac{P_{\text{wall}}}{E_{\text{cm}}} \frac{\eta}{\sigma_y} N_\gamma H_D$$

P_{wall} = total wall-plug power; E_{cm} = center mass energy;

η = efficiency of converting wall-plug power into beam power

N_γ = number of beamstrahlung photons emitted per e+/-

H_D = enhancement of luminosity due to the pinch effect during bunch crossing

Luminosity performance for e^+e^- colliders

F. Gianotti

Note 1: Peak luminosity at SLC (92 GeV) was $\sim 10^{30}$ cm⁻²s⁻¹

Note 2: Peak luminosity at LEP2 (209 GeV) was $\sim 10^{32}$ cm⁻²s⁻¹

SLC (Stanford Linear Collider) – California - USA

The first and only Linear Collider who was running with a beam e^- (45.6 GeV) and e^+ (45.6 GeV)

3.2 km (2 miles) S-band linac

Operation: 1989-1998

SLC (Stanford Linear Collider) – California - USA

2 experiments: MARK II, SLD
Peak Luminosity: $2 \times 10^{30} \text{cm}^{-2} \text{s}^{-1}$

Final beam energy

$$E_{\text{cm}} = 92 \text{ GeV}$$

80% electron-beam
polarization

Updated Staging
Baseline 2016

<http://dx.doi.org/10.5170/CERN-2016-004>

Project Implementation
Plan 2018

CLIC roadmap

2013 - 2019 Development Phase

Development of a Project Plan for a staged CLIC implementation in line with LHC results; technical developments with industry, performance studies for accelerator parts and systems, detector technology demonstrators

2020 - 2025 Preparation Phase

Finalisation of implementation parameters, preparation for industrial procurement, Drive Beam Facility and other system verifications, Technical Proposal of the experiment, site authorisation

2026 - 2034 Construction Phase

Construction of the first CLIC accelerator stage compatible with implementation of further stages; construction of the experiment; hardware commissioning

2019 - 2020 Decisions

Update of the European Strategy for Particle Physics; decision towards a next CERN project at the energy frontier (e.g. CLIC, FCC)

2025 Construction Start

Ready for construction; start of excavations

2035 First Beams

Getting ready for data taking by the time the LHC programme reaches completion

ILC Collaborations

ILC in Japan

Kitakami mountains

ILC layout

8370 superconducting cavities in 930 cryo-modules
Gradient 31.5 MV/m RF Frequency 1.3 GHz
Beam polarization: e- 80%, e+ 30%

ILC parameters

Quantity	Unit	ILC250	ILC500	ILC1000
Centre-of-mass energy	GeV	250	500	1000
Luminosity	$10^{34}\text{cm}^{-2}\text{s}^{-1}$	1.35	1.8	4.9
Repetition frequency	Hz	5	5	4
Bunches per pulse	1	1312	1312	2450
Bunch population	10^{10}e^-	2	2	1.74
Linac bunch interval	ns	554	554	366
Beam current in pulse	mA	5.8	5.8	7.6
Beam pulse duration	s	727	727	897
Average beam power	MW	5.3	10.5	27.2
Norm. hor. emitt. at IP	μm	5	10	10
Norm. vert. emitt. at IP	nm	35	35	35
RMS hor. beam size at IP	nm	516	474	335
RMS vert. beam size at IP	nm	7.7	5.9	2.7
Site AC power	MW	129	163	300
Site length	km	20.5	31	40

Extendability built-in

Going from 250 GeV to 1 TeV

ILC Site & Infrastructure

- 67 km maximal length of tunnel
- Beam dumps, etc designed for 1 TeV operation
- Overall recommended ILC power limit for the 1 TeV ILC : 300 MW

Luminosity upgrades

- Straightforward: Increasing the number of bunches from 1312 to 2624
- Power Increase 129 MW → 164 MW

Energy upgrades

- Energy upgrades to 350 GeV ($t\bar{t}$ threshold) and ~500 GeV being discussed
- 1 TeV for longer-term plan

DESY | ILC | 103rd Plenary ECFA | Marcel Stanitzki

DIRECTOR'S UPDATE

Clarifications on the report from the Science Council of Japan regarding the ILC

The report released by the Science Council of Japan on 19 December on the realisation of the ILC raised many questions within the linear collider community. The ILC Planning Office at KEK asks for continuing support.

Special issue
21 December 2019

IC NEWSLINE

Linear Muon collider

F. Zimmermann, “*Final Focus Challenges for Muon Colliders at Highest Energies*,” CERN-SL-99-077-AP.- AIP Conf. Proc.: 530 (1999) , pp. In : Colliders and Collider Physics at the Highest Energies : Muon Colliders at 10 TeV to 100 TeV, Montauk, NY, USA, 27 Sep - 1 Oct 1999, pp.347-367

Table 4: Parameters for Single Pass Muon collider

parameter	symbol	SPMC-0	SPMC-I	SPMC-II	SPMC-III
cm energy [TeV]	E_{cm}	3	10	100	1000
luminosity [10^{35} cm $^{-2}$ s $^{-1}$]	L	1.2	2.1	7.2	5.4
beam energy [TeV]	E_b	1.5	5	50	500
muons/bunch [10^{12}]	N_b	5	3	0.8	0.2
bunches/train	n_b	1	1	1	1
repetition rate [Hz]	f_{rep}	160	27	7.9	3.2
normalized tr. emittances [μ m]	$\gamma\epsilon_{x,y}$	15	2	0.5	0.25
6-dim. normalized emittance [10^{-12} m 3]	$\gamma^3\epsilon_{6d}$	16	1.5	0.23	0.30
rms energy spread	δ_{rms}	1%	1%	1%	1%
rms bunch length [mm]	σ_z	0.5	0.8	0.2	0.1
relativistic Lorentz factor [10^4]	γ	1.41	4.7	47	473
IP beta functions [mm]	$\beta_{x,y}^*$	0.5	0.8	0.2	0.1
IP spot sizes [nm]	$\sigma_{x,y}$	730	184	14.5	2.3
beamstrahlung energy loss	δ_B	7×10^{-7}	8×10^{-6}	4×10^{-3}	0.14
Upsilon parameter	Υ	2×10^{-6}	1.0×10^{-5}	1.4×10^{-3}	0.04
beamstrahlung photons/lepton	N_γ	0.71	1.67	5.61	8.43
luminosity enhancement factor	H_D	2.00	3.67	3.77	2.83

1-3 July 2018
Università di Padova - Orto Botanico

[Muon](#) Collider workshop Italy

Muon colliders

*Carlo Rubia / INFN / CERN
Padova workshop 2018*

Advantages

- Large cross sections $\sigma (\mu^+\mu^- \rightarrow h) = 35 \text{ pb}$ in s-channel resonance and 0.2 pb for $\mu^+\mu^- \rightarrow ZH$ of at $\approx 1/2 \text{ TeV}$.
- Small size footprint: they may fit within the ESS site
- No synchrotron radiation and beamstrahlung problems
- Precise measurements of line shape and total decay width Γ
- Exquisite measurements of all channels and tests of SM.
- The cost of the facility, provided cooling will be successful, is of the order of a fraction of one of the LHC.

Challenges

- A low cost demonstration of muon cooling must be done first
- Muon 2D and 3D cooling needs to be demonstrated
- Need ultimately very small c.o.m energy spread (0.003%)
- Backgrounds from constant muon decay
- Significant R&D required towards end-to-end design

Questions for a future high energy linear collider

For electron-positron collisions, what are the goals for the energy and the luminosity ? Probably the higher is better but for a future project, the justifications are crucial (cost, power consumption,....)

For gamma-gamma collisions, some issues relative to positrons can be solved and beamstrahlung limit can be avoided. Can one justify a stand-alone project ?

For the Novel Acceleration Technologies, what are the remaining R&D's to make a jump between the facility and the real machine ?

For a future high energy linear colliders => which types of particles ?

Many fundamental questions remain open

Fabiola Gianotti / 16/01/2018 CERN

PUZZLING: the SM is not a complete theory of particle physics, as several outstanding questions remain that cannot be explained within the SM

What is the composition of dark matter (~25% of the Universe) ?
What is the cause of the Universe's accelerated expansion (today: dark energy?; primordial: inflation?)
What is the origin of neutrino masses and oscillations ?
Why 3 fermion families ? Why do neutral leptons, charged leptons and quarks behave differently?
What is the origin of the matter-antimatter asymmetry in the Universe ?
Why is the Higgs boson so light (so-called "naturalness" or "hierarchy" problem) ?
Why is Gravity so weak ?
Etc. etc.

These questions require **NEW PHYSICS**
→ but where is the new physics in terms of E-scale and couplings to SM particles ???

The future of high energy physic is very exciting !!!

Conclusion

The forthcoming physic results are decisive to define a precise roadmap for the future.

For an high energy collider, we cannot test and demonstrate everything => various test facilities are essential.

Two crucial parameters: make high energies cheaper and increase the luminosity as much as possible.

Try to make credible an high energy collider.

JUAS students are the future machine builders

..... for future high energy particle accelerators !

ILC Cost

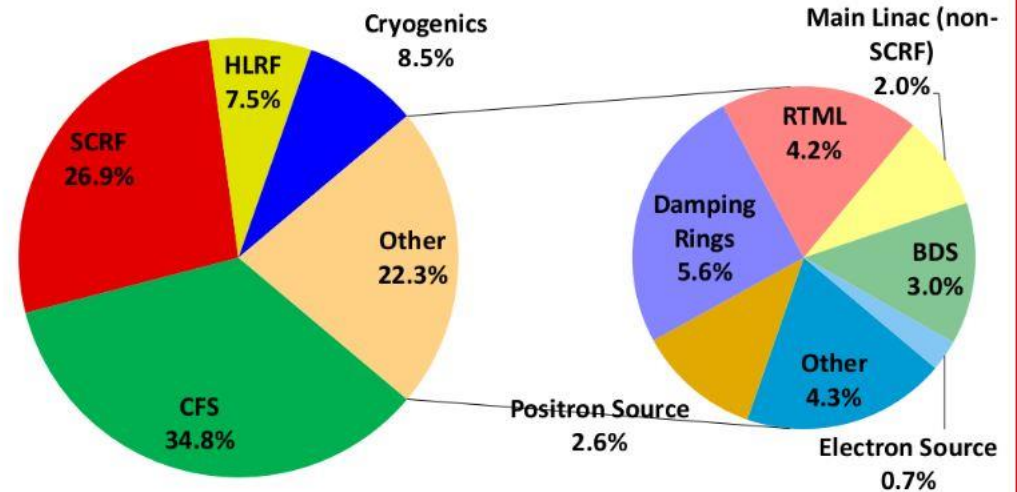

Accelerator Costing

ILC250 Baseline

ILC costing model

- Established for the TDR
 - Including set-up and learning curves
- TDR (500 GeV)
 - 7.98 Billion US-\$
- Updates since
 - All experiences from the E-XFEL, ESS, LCLS-II
 - Higher Gradient Cavities
- ILC 250 baseline
 - 40% cost reduction
 - 1/3 Construction (CFS)

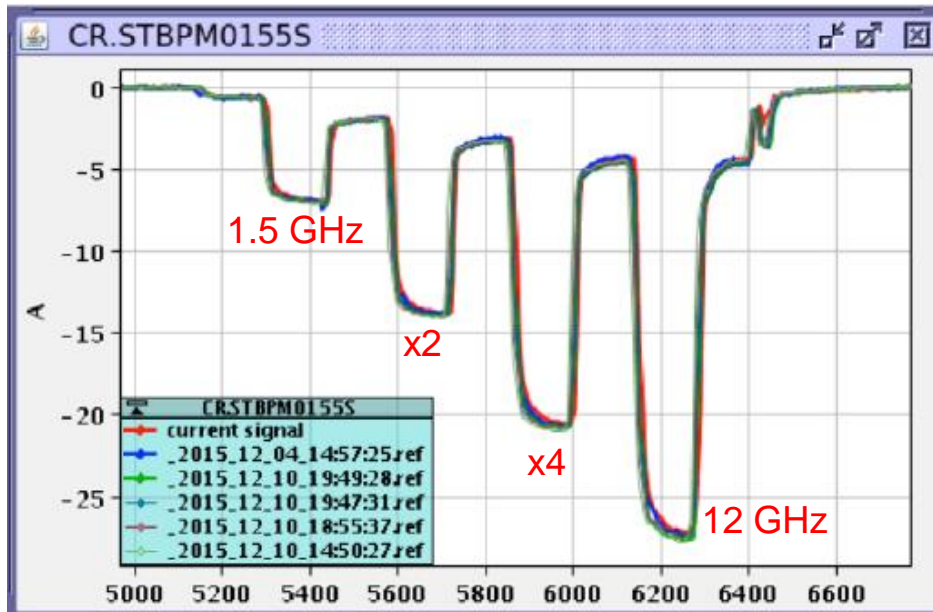

Primary cost drivers for the ILC

Results obtained in CTF3

Drive beam quality:

Produced high-current drive beam bunched at 12GHz

Current in combiner ring

Drive beam arrival time stabilised to CLIC specification of 50fs:

Examples of measurements from CTF3 (CLIC Test Facility)

CTF3 modified => CLEAR (CERN Linear Electron Accelerator for Research)

Results obtained in CTF3

Demonstrated 2-beam acceleration

31MeV = 145MV/m

Accelerator challenges

X-band performance: achieved 100MV/m gradient in main-beam RF cavities

Key challenges:

High-current drive beam
bunched at 12 GHz

Power transfer +
main-beam acceleration

~100 MV/m gradient in
main-beam cavities

Low emittance generation

Alignment & Stability

Accelerator challenges

Nano-beams The CLIC strategy:

Key challenges:

High-current drive beam bunched at 12 GHz

Power transfer + main-beam acceleration

~100 MV/m gradient in main-beam cavities

Low emittance generation

- Align components (10 μ m over 200m)
- Control/damp vibrations (from ground to accelerator)
- Measure beams well – allow to steer beam and optimize positions
- Algorithms for measurements, beam and component optimization, feedbacks
- Tests in existing accelerators of equipment and algorithms (FACET at Stanford, ATF2 at KEK, CTF3, Light-sources)
