Why dynamical symmetry breaking?

What is the orgin of fermion masses?

We know most of the fermion masses and mixings but do not understand their structure. For instance, why $m_t \gg m_f$?

The root of the problem could stem from the Yukawa couplings

- Contain many unphysical parameters
- Depend on the basis
- Depend on the renormalization scale

Linked to the Higgs mechanism which,

- Parametrizes with complete generality all we see
- It is renormalizable (no clue on new scales)

If the Higgs is not elementary:

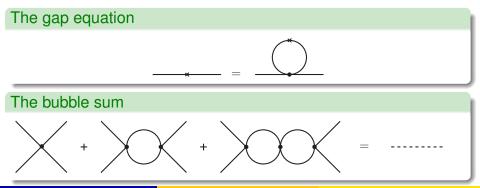

- New scale
- No (fundamental) Yukawa couplings, and perhaps.

The Bardeen-Hill-Lindner mechanism

- SM with no Higgs
- With a new strong interaction between four top-quarks one can implement the Nambu-Jona-Lasinio (NJL) mechanism of SSB

$$\mathscr{L} = \mathscr{L}_{\mathtt{MSM}} + \mathscr{L}_{4\mathrm{f}}, \quad \mathscr{L}_{4\mathrm{f}} = G\left(\overline{Q_L}t_R\right)\left(\overline{t_R}Q_L\right)$$

The NJL approach:

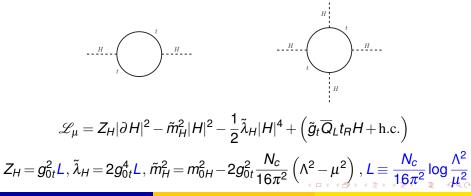

Arcadi Santamaria (IFIC/U. València-CSIC)

Bosonization approach

Four-fermion interaction equivalent to (just use the EM)

$$\mathscr{L}_{4\mathrm{f}} \to \mathscr{L}_{\mathrm{H}\Lambda} = -m_{0H}^2 |H|^2 + \left(g_{0t}\overline{Q_L}t_RH + \mathrm{h.c.}\right), \qquad G = \frac{g_{0t}^2}{m_{0H}^2}$$

At $\mu = \Lambda$, *H* no kinetic term, no potential (apart from the mass term). At $\mu < \Lambda$ top quark loops generate *H* kinetic terms and potential

Bosonization: the predictions for m_t and m_h

Now we rescale the field $H \rightarrow H/\sqrt{Z_H}$ and obtain the SM Lagrangian

$$\mathscr{L}_{\mu R} = |\partial H|^2 - m_H^2 |H|^2 - \frac{1}{2} \lambda_H |H|^4 + \left(g_t \overline{Q}_L t_R H + \text{h.c.} \right)$$

with

$$m_H^2 = \tilde{m}_H^2 / Z_H, g_t^2 = g_{0t}^2 / Z_H = \frac{1}{L}, \quad \lambda_H = \tilde{\lambda}_H / Z_H^2 = \frac{2}{L} = 2g_t^2$$

$$g_t \text{ and } \lambda_H \text{ diverge together when } \mu = \Lambda \ (L = 0). \text{ If } \langle H \rangle = v / \sqrt{2}$$

$$m_t = g_t(m_t) \frac{v}{\sqrt{2}}, \quad m_h^2 \approx \lambda_H(m_t) v^2 = 2g_t^2(m_t) v^2 = 4m_t^2$$

Prediction for the top-quark mass once Λ is given

$$g_t^2(m_t) = \frac{1}{L} = \frac{16\pi^2}{N_c \log(\Lambda^2/m_t^2)} \to m_t^2 = \frac{8\pi^2 v^2}{N_c \log(\Lambda^2/m_t^2)}$$
$$m_t^2 = -\frac{8\pi^2 v^2}{N_c \Lambda^2 W_{-1} \left(-\frac{8\pi^2 v^2}{N_c \Lambda^2}\right)} \approx v^2 \frac{8\pi^2}{N_c} \frac{1}{\log\left(\frac{N_c \Lambda^2}{8\pi^2 v^2}\right)}$$

Arcadi Santamaria (IFIC/U. València-CSIC)

4/17

Connection with the RGE

From the equations above we can compute the fermion-loop RGE for g_t^2 and λ_H

$$\frac{dg_t^2}{dt} = 2N_c g_t^4 , \qquad \frac{d\lambda_H}{dt} = 4N_c g_t^4 , \quad t \equiv \frac{1}{16\pi^2} \log \frac{\mu}{m_z}$$

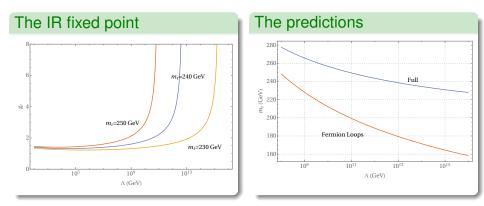

to be compared with the SM RGE (for the moment we neglect gauge interactions)

$$rac{dg_t^2}{dt}=(3+2N_c)g_t^4\;,\qquad rac{d\lambda_H}{dt}=12\lambda_H^2+4N_c\lambda_Hg_t^2-4N_cg_t^4$$

agree if we take only fermion loops and use $\lambda_H = 2g_t^2$. For $\mu < \Lambda$ Higgs and gauge interactions should be included

$$\frac{dg_t^2}{dt} = g_t^2 \left(9g_t^4 - 16\frac{g_3^2}{3} - \frac{9}{2}g_2^2 - \frac{17}{6}g_1^2\right)$$

The SM results: *m*_t

- The IR fixed point gives robust predictions
- The predictions in the SM are too high:

$$m_t \approx 225 \,\mathrm{GeV}\,, \quad \Lambda = 10^{16} \,\mathrm{GeV}$$

イロト イポト イヨト イヨト

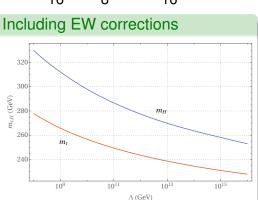

The Higgs boson mass

Only fermion loops give $\lambda_H = 2g_t^2$ but

$$\begin{aligned} \frac{d\lambda_H}{dt} &= 12\left(\lambda_H^2 + g_{2w}^4 + \lambda_H(g_t^2 - g_{1w}^2) - g_t^4\right)\\ g_{1w}^2 &= \frac{1}{4}g'^2 + \frac{3}{4}g_2^2, \qquad g_{2w}^4 = \frac{1}{16}g'^4 + \frac{1}{8}g'^2g_2^2 + \frac{3}{16}g_2^4 \end{aligned}$$

Neglecting EW interactions and taking $\lambda_H = cg_t^2$

$$m_h = m_t \sqrt{2c} = 1.3m_t$$

Why not additional interactions?

- Needed to explain lighter fermion masses
- Sometimes unavoidable

$$\left(\overline{Q_L}\gamma^{\mu}Q_L\right)\left(\overline{t_R}\gamma^{\mu}t_R\right) \to \left(\overline{Q_L}t_R\right)\left(\overline{t_R}Q_L\right), \left(\overline{Q_L}\lambda^a t_R\right)\left(\overline{t_R}\lambda^a Q_L\right)$$

Several attempts with four-fermion interactions leading to different low energy particle spectrum (for a review see Cvetic (1999),Hill & Simmons (2003)):

- 2HDM
- Supersymmetry
- Neutrino condensates
- General non-coloured bounstates
- New (boundstate) scalars introduced to give small radiative b, τ masses

In general difficult to obtain the right m_t and $m_{H_{a}}$

-

Bottom up approach

Which scalars can we couple to the top-quark?

$$\begin{split} \overline{Q_L} t_R &\sim (1, 2, 1/2), (8, 2, 1/2) \\ \overline{Q_L} b_R &\sim (1, 2, -1/2), (8, 2, -1/2) \\ \overline{Q_L} Q_L^c &\sim (\mathbf{3}_a, \mathbf{1}_a, -1/3), (\mathbf{3}_a, \mathbf{3}_s, -1/3), (\bar{\mathbf{6}}_s, \mathbf{1}_a, -1/3), (\bar{\mathbf{6}}_s, \mathbf{3}_s, -1/3) \\ \overline{t_R} t_R^c &\sim (\bar{\mathbf{6}}_s, \mathbf{1}, -4/3) \\ \overline{t_R} b_R^c &\sim (\mathbf{3}_a, \mathbf{1}, -1/3), (\bar{\mathbf{6}}_s, \mathbf{1}, -1/3) \end{split}$$

For instance $(\overline{t_R}t_R^c)(\overline{t_R^c}t_R)$ obtained from color-sextet $g_{\omega}\overline{t_R}t_R^c\omega$ Additional (positive) contributions to the g_t running

$$\frac{dg_t^2}{dt} = g_t^2 \left(9g_t^4 + 8g_\omega^2 - 16g_3^2 + \cdots\right)$$

Helps g_t to diverge faster!

Femion loop approximation with extra scalars

then

$$\mathscr{L}_{\Lambda} = -m_{0H}^2 |H|^2 - m_{0\omega}^2 |\omega|^2 + \left(g_{0t}\overline{Q}_L t_R H + g_{0\omega}\overline{t_R}t_R^c \omega + \text{h.c.}\right)$$

$$\begin{aligned} \mathscr{L}_{\mu} &= Z_{H} |\partial H|^{2} - \tilde{m}_{H}^{2} |H|^{2} - \frac{1}{2} \tilde{\lambda}_{H} |H|^{4} + \left(g_{0t} \overline{Q}_{L} t_{R} H + g_{0\omega} \overline{t_{R}} t_{R}^{c} \omega + \text{h.c.} \right) + \\ &+ Z_{\omega} |\partial \omega|^{2} - \tilde{m}_{\omega}^{2} |\omega|^{2} - \tilde{\lambda}_{2} |H|^{2} |\omega|^{2} - \frac{1}{2} \tilde{\lambda}_{\omega} |\omega|^{4} \\ Z_{H} &= g_{0t}^{2} L, \quad \tilde{\lambda}_{H} = 2g_{0t}^{4} L, \quad \tilde{m}_{H}^{2} = m_{0H}^{2} - 2g_{0t}^{2} \frac{N_{c}}{16\pi^{2}} \left(\Lambda^{2} - \mu^{2} \right) \\ Z_{\omega} &= g_{0\omega}^{2} \kappa_{Z} L, \quad \tilde{\lambda}_{\omega} = g_{0\omega}^{4} \kappa_{\lambda} L, \quad \tilde{\lambda}_{2} = g_{0\omega}^{2} g_{0t}^{2} \kappa_{2} L \\ \tilde{m}_{\omega}^{2} &= m_{0\omega}^{2} - 2g_{0\omega}^{2} \frac{\kappa_{m}}{16\pi^{2}} \left(\Lambda^{2} - \mu^{2} \right) \end{aligned}$$

イロト イポト イヨト イヨト 二日

Femion loop approximation predictions

Now after renormalization $H \rightarrow H/\sqrt{Z_H}$, $\omega \rightarrow \omega/\sqrt{Z_\omega}$

$$\begin{split} \mathscr{L}_{\mu} &= |\partial H|^2 - m_{H}^2 |H|^2 - \frac{1}{2} \lambda_{H} |H|^4 + \left(g_t \overline{Q}_L t_R H + g_\omega \overline{t_R} t_R^c \omega + \text{h.c.} \right) \\ &+ |\partial \omega|^2 - m_{\omega}^{\prime 2} |\omega|^2 - \lambda_2 |H|^2 |\omega|^2 - \frac{1}{2} \lambda_{\omega} |\omega|^4 \end{split}$$

with

$$m_{H}^{2} = \tilde{m}_{H}^{2} / Z_{H}, g_{t}^{2} = g_{0t}^{2} / Z_{H} = \frac{1}{L}, \quad \lambda_{H} = \tilde{\lambda}_{H} / Z_{H}^{2} = \frac{2}{L} = 2g_{t}^{2}$$
$$m_{\omega}^{\prime 2} = \tilde{m}_{\omega}^{2} / Z_{\omega}, \qquad g_{\omega}^{2} = g_{0\omega}^{2} / Z_{\omega} = \frac{1}{\kappa_{Z}L} = \frac{1}{\kappa_{Z}}g_{t}^{2},$$
$$\lambda_{\omega} = \tilde{\lambda}_{\omega} / Z_{\omega}^{2} = \frac{\kappa_{\lambda}}{\kappa_{Z}^{2}L} = \frac{\kappa_{\lambda}}{\kappa_{Z}^{2}}g_{t}^{2}, \quad \lambda_{2} = \tilde{\lambda}_{2} / (Z_{H}Z_{\omega}) = \frac{\kappa_{2}}{\kappa_{Z}L} = \frac{\kappa_{2}}{\kappa_{Z}}g_{t}^{2}$$

- Same prediction as the SM for the top quark mass
- Same prediction for the Higgs mass
- Rest of couplings predicted in terms of g_t

$$y - cx = Kx^{\alpha}y^{\beta}$$

$$c = \frac{a_{11} - a_{21}}{a_{22} - a_{12}}, \qquad \alpha = \frac{a_{22}(a_{11} - a_{21})}{a_{11}a_{22} - a_{12}a_{21}}, \qquad \beta = \frac{a_{11}(a_{22} - a_{12})}{a_{11}a_{22} - a_{12}a_{21}}$$

Arcadi Santamaria (IFIC/U. València-CSIC)

Dynamical EWSB and exotic scalars

NonMinimal Higgs, Helsinki 19 13 / 17

The IR fixed point

In presence of QCD, the beta functions can reach zero

SM this happens for

$$g_t^2 = rac{16}{9}g_3^2
ightarrow m_t \sim 280\,{
m GeV}$$

Extra scalars

$$a_{11}x + a_{12}y = c_1z$$
, $a_{21}x + a_{22}y = c_2z$
 $a_{21}x + a_{22}y = c_2z$

Triplet

$$g_t^2 = \frac{24}{17}g_3^2$$
, $g_\omega^2 = \frac{7}{17}g_3^2 \to m_t \sim 250 \,\mathrm{GeV}$

Sextet

$$g_t^2 = rac{48}{37}g_3^2$$
, $g_\omega^2 = rac{20}{37}g_3^2
ightarrow m_t \sim 240\,{
m GeV}$

Octet

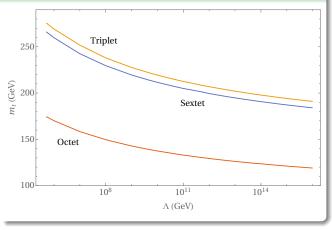

$$g_t^2 = \frac{16}{33}g_3^2$$
, $g_\omega^2 = \frac{16}{11}g_3^2 \rightarrow m_t \sim 150 \,\text{GeV}$

14/17

Full result (Preliminary)

Including EW corrections Stopping new scalar contributions at $m_{\omega} = 1 \text{ TeV}$

The Higgs boson mass

$$\frac{d\lambda_H}{dt} = 12\left(\lambda_H^2 + g_{2w}^4 + \lambda_H(g_t^2 - g_{1w}^2) - g_t^4 + c_H\lambda_2^2\right)$$
$$c_H(\text{triplet}) = \frac{1}{8}, \quad c_H(\text{sextet}) = \frac{1}{4}, \quad c_H(\text{octet simplified}) = \frac{2}{3}$$

Strongly depends on the running of λ_2 which depends on all other couplings, for $\Lambda=10^{16}\,{\rm GeV}$

- Triplet: $m_H \gtrsim 210 \, \text{GeV}$
- Sextet: *m_H* ≥ 200 GeV
- Octet, tends to give a too light Higgs boson mass (for the correct top-quark mass) but the potential is very complicated

$$V = \lambda \left(H^{\dagger i} H_i - \frac{v^2}{2} \right)^2 + 2m_s^2 \operatorname{Tr} S^{\dagger i} S_i + \lambda_1 H^{\dagger i} H_i \operatorname{Tr} S^{\dagger j} S_j + \lambda_2 H^{\dagger i} H_j \operatorname{Tr} S^{\dagger j} S_i + \left(\lambda_3 H^{\dagger i} H^{\dagger j} \operatorname{Tr} S_i S_j + \lambda_4 e^{i\phi_4} H^{\dagger i} \operatorname{Tr} S^{\dagger j} S_j S_i + \lambda_5 e^{i\phi_5} H^{\dagger i} \operatorname{Tr} S^{\dagger j} S_i S_j + \operatorname{H.c.} \right) + \lambda_6 \operatorname{Tr} S^{\dagger i} S_i S^{\dagger j} S_j + \lambda_7 \operatorname{Tr} S^{\dagger i} S_j S^{\dagger j} S_i + \lambda_8 \operatorname{Tr} S^{\dagger i} S_i \operatorname{Tr} S^{\dagger j} S_j + \lambda_9 \operatorname{Tr} S^{\dagger i} S_j \operatorname{Tr} S^{\dagger j} S_i + \lambda_{10} \operatorname{Tr} S_i S_j \operatorname{Tr} S^{\dagger i} S^{\dagger j} + \lambda_{11} \operatorname{Tr} S_i S_j S^{\dagger j} S^{\dagger i}.$$
