July 31, 2019

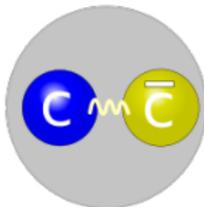

Introduction

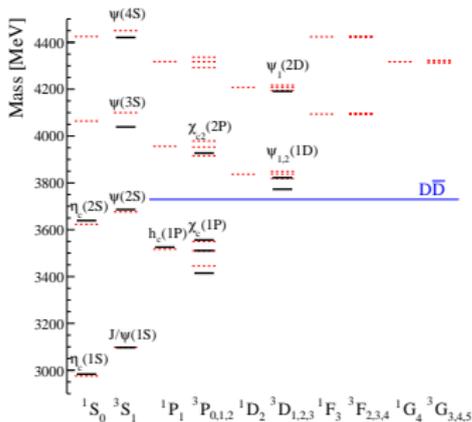

Charmonium

- Charmonium $c\bar{c}$ states with radial & angular excitation.

Charmonium

Spectrum

- Number of states discovered that don't fit the charmonium model ($c\bar{c}$).
 - For example (*state discussed in this presentation*):
 - $Z_c(3900)$ discovered by BELLE and BESII

$$e^+e^- \rightarrow Y(4260)$$

$$Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$$

$$Z_c^\pm(3900) \rightarrow J/\psi\pi^\mp$$

Belle: Phys. Rev. Lett. 110, 252001 (2013)

BESII: Phys. Rev. Lett. 110, 252002 (2013)

- Decay is similar to a charmonium excited state for example: $\psi(2S) \rightarrow J/\psi\pi^+\pi^-$
- $Z_c(3900)$ cannot be charmonium since it is charged and decays via the strong interaction to charmonium.
- Minimum quark content $c\bar{c}u\bar{d}$.

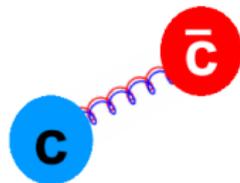

Strongly bound:

Tetraquarks

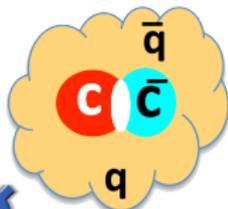

$c\bar{c}$ - gluon hybrid

Weakly bound:

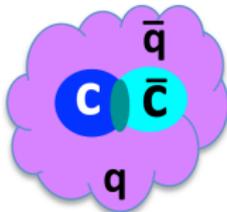

Hadroncharmonium

Color Singlet $c\bar{c}$

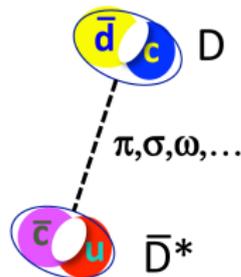

Hadroncharmonium

Color Octet $c\bar{c}$

Mesonic Molecule

Evidence for $H_b \rightarrow Z_c^\pm(3900)\pi^\mp + X$

Introduction

- DØ has performed a search for $Z_c(3900)$ from b hadrons (H_b) decays at $\sqrt{s} = 1.96$ TeV using $\int \mathcal{L} dt = 10.4 \text{ fb}^{-1}$
Phys. Rev. D **98**, 052010 (2018)
- Previous searches using exclusive hadronic decays proved inconclusive:
 - Belle – Not observed $\bar{B}^0 \rightarrow (J/\psi\pi^+)K^-$
Phys. Rev. D **90**, 112009 (2014)
 - LHCb – Not observed $B^0 \rightarrow (J/\psi\pi^+)\pi^-$
Phys. Rev. D **90**, 012003 (2014)
 - BaBar – Maybe observed $\bar{B}^0 \rightarrow J/\psi\pi\pi K$
Phys. Rev. D **73**, 011101 (2006)
- Since the process may be spread over many channels DØ used a semi-inclusive search $H_b \rightarrow Y(4260) + X$.

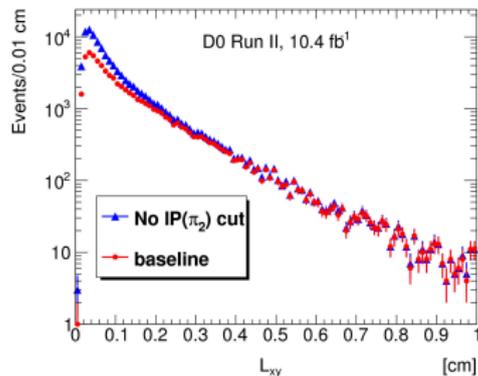

Evidence for $H_b \rightarrow Z_c^\pm(3900)\pi^\mp + X$

Search Strategy

Phys. Rev. D **98**, 052010 (2018)

- Search topology $Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp \rightarrow (J/\psi\pi^\pm)\pi^\mp$
 - Hence a secondary vertex comprised of $J/\psi \rightarrow \mu^+\mu^-$ plus 2 opposite sign charged particle tracks.
- Vertex requirements: secondary vertex pointing at primary vertex; impact parameter in added tracks.
- Invariant mass requirement $4.1 < M_{J/\psi\pi^\pm\pi^\mp} < 5.0$ GeV
 - Less than lowest B meson mass
 - Includes $Y(4260)$

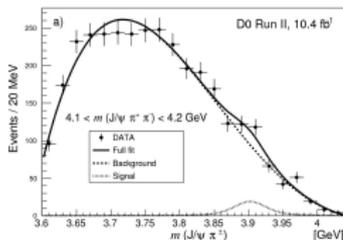

Transverse Decay Length

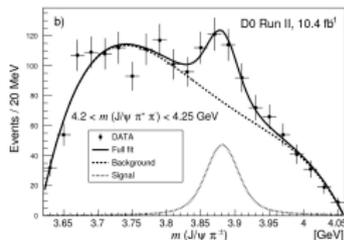

Evidence for $H_b \rightarrow Z_c^\pm(3900)\pi^\mp + X$

$J/\psi\pi^+\pi^-$ Invariant Mass

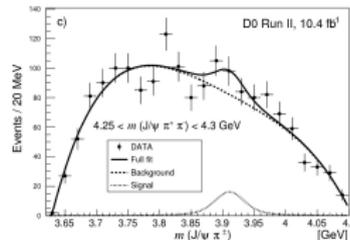

4.1 $< M(J/\psi\pi^+\pi^-) < 4.2$ GeV

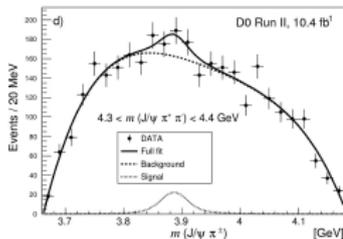

4.2 $< M(J/\psi\pi^+\pi^-) < 4.25$ GeV

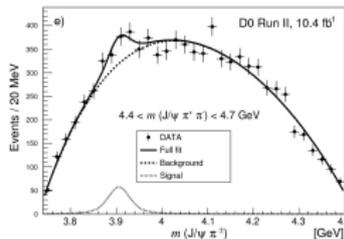

4.25 $< M(J/\psi\pi^+\pi^-) < 4.3$ GeV

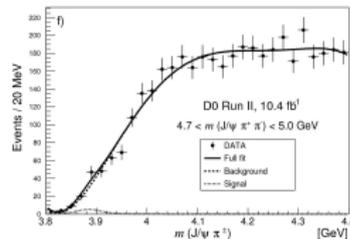

4.3 $< M(J/\psi\pi^+\pi^-) < 4.4$ GeV

4.4 $< M(J/\psi\pi^+\pi^-) < 4.7$ GeV

4.7 $< M(J/\psi\pi^+\pi^-) < 5.0$ GeV

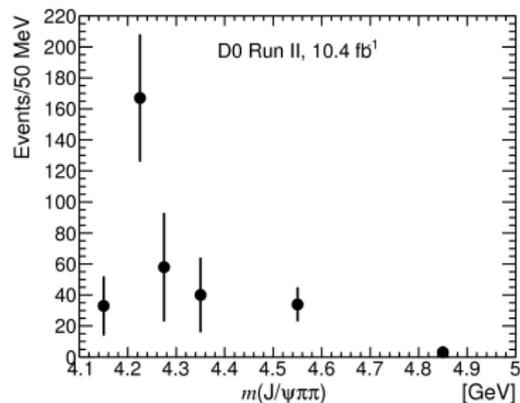

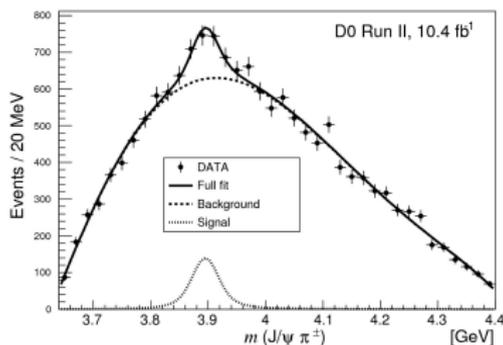

Evidence for $H_b \rightarrow Z_c^\pm(3900)\pi^\mp + X$

$Z_c(3900)$ Signal

- Signal at $M(J/\psi\pi^\pm) = 3895.0 \pm 5.2$ (stat) $_{-2.7}^{+4.0}$ (syst) MeV
- Significance of 4.6σ (with syst.)

$4.2 < M(J/\psi\pi^\pm\pi^\mp) < 4.7$ GeV

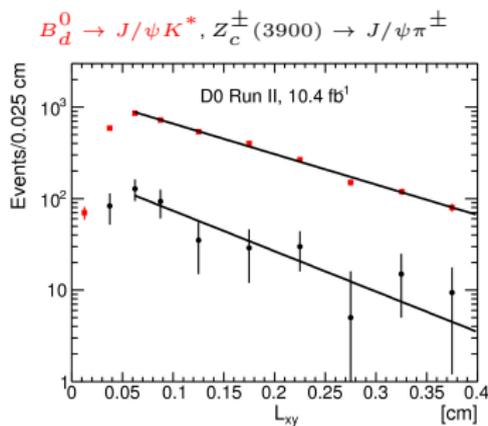

Evidence for $H_b \rightarrow Z_c^\pm(3900)\pi^\mp + X$

DØ Results

- Rate relative to $B_d^0 \rightarrow J/\psi K^*$

$$\frac{N \left[H_b \rightarrow \left(Z_c^\pm(3900) \rightarrow J/\psi \pi^\pm \right) \pi^\mp + X \right]}{N \left[B_d^0 \rightarrow J/\psi K^* \right]} = 0.085 \pm 0.019$$

$$\frac{N \left[H_b \rightarrow \left(Z_c^\pm(3900) \rightarrow J/\psi \pi^\pm \right) K^\mp \right]}{N \left[B_d^0 \rightarrow J/\psi K^* \right]} < 0.015 \text{ at } 90\% \text{ C.L.}$$

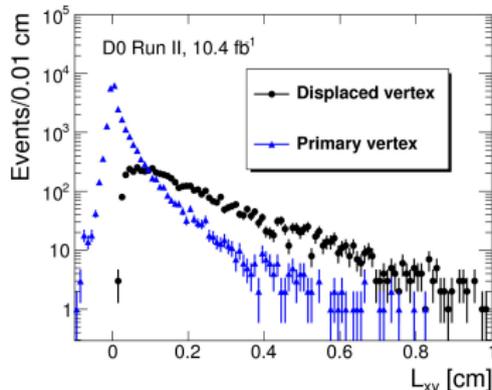

Prompt Production $Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$

Outline

Phy. Rev. D **100** 012005

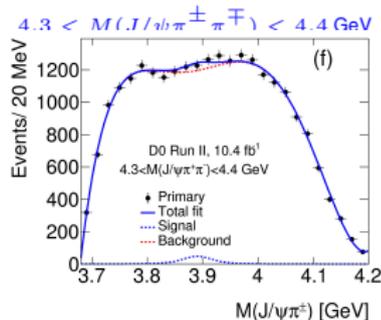

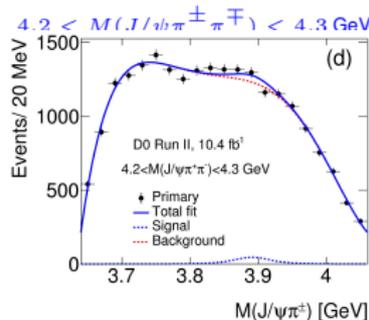

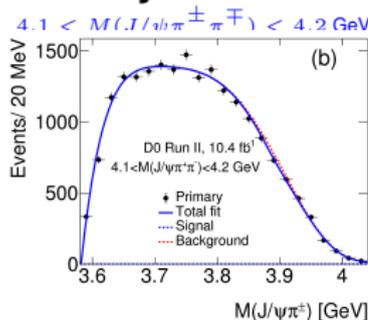

- Same channel $Y(4260) \rightarrow (J/\psi\pi^\pm) \pi^\mp$.
- Data is reprocessed to optimize low p_T track reconstruction (50%) increase in sample.
- Split data into 2 non-overlapping subsets:
 - Consistent with primary vertex.
 - Displaced vertex.

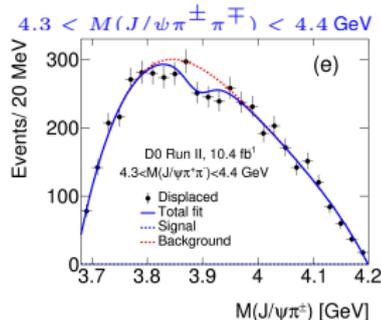

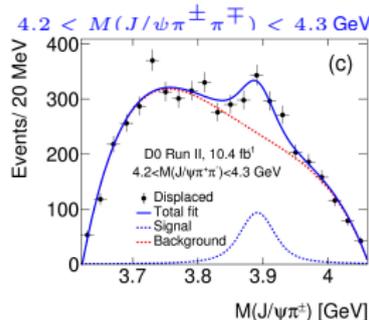

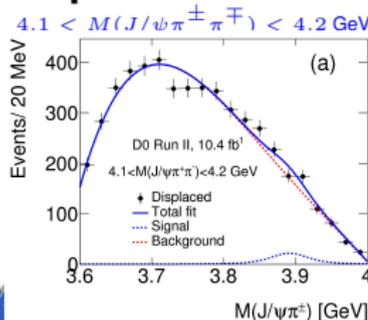

Prompt Production $Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$

Invariant Mass

Primary vertex

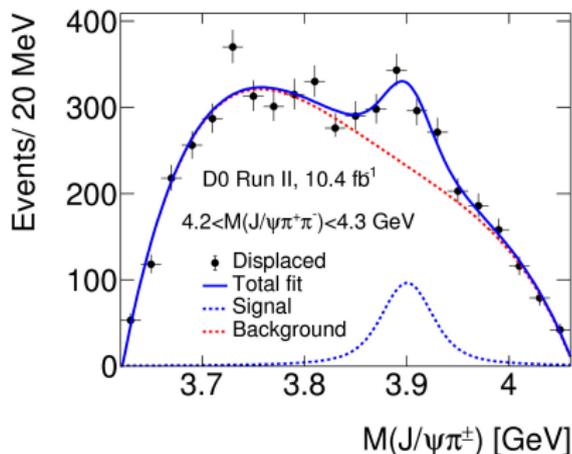

Displaced Vertex

Prompt Production $Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$

Results $Z_c(3900)$ properties

- For the $Y(4260)$ displaced vertex mass range $4.2 < M(J/\psi\pi^\pm\pi^\mp) < 4.3$ GeV
 - Signal significance 5.4σ
 - $M = 3902.6 \pm 5.2$ (stat) $_{-1.4}^{+3.4}$ (syst) MeV
 - $\Gamma = 32_{-21}^{+28}$ (stat) $_{-7}^{+26}$ (syst) MeV

Prompt Production $Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$

Results prompt production

State

$N_{\text{prompt}}/N_{\text{non-prompt}}$

$Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$

< 0.7 at 95% C.L.

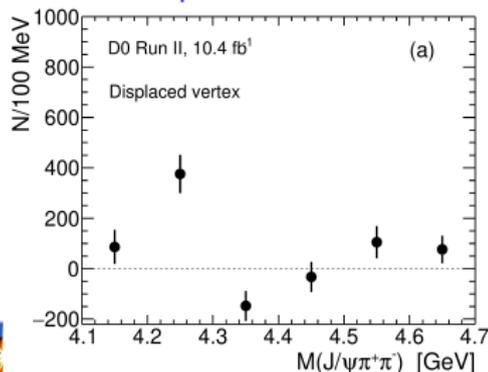

$X(3872) \rightarrow J/\psi\pi^\pm\pi^\mp$

≈ 2.5 CMS & ATLAS

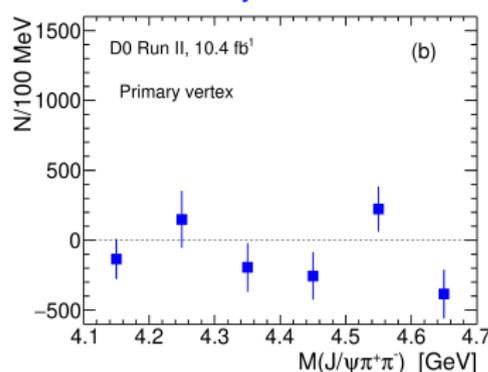

$X(4140) \rightarrow J/\psi\phi$

≈ 1.5 DØ

Displaced Vertex

Primary Vertex

- Measured the properties of the $Z_c(3900)$
- Observed $Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$ in semi-inclusive H_b decays.
 - But not in $B_d^0 \rightarrow J/\psi\pi^+K^-$
- Prompt production of the $Y(4260) \rightarrow Z_c^\pm(3900)\pi^\mp$ is not observed.
 - Significantly less than $X(3872)$ and $X(4140)$.

DØ nabs $Z_c^+(3900)$

Following first observations of the charmonium-like state $Z_c^+(3900)$ at e^+e^- colliders in 2013, the DØ collaboration has published 5.4σ evidence for its presence in the decay chain of b-quarks in $p\bar{p}$ collisions
