## **COHERENT Plans for D<sub>2</sub>O detector at the Spallation Neutron Source**

*Thursday 1 August 2019 14:20 (15 minutes)*

The Spallation Neutron Source (SNS) is a pulsed source of neutrons and, as a byproduct of this operation, an intense source of neutrinos via stopped-pion decay. The COHERENT collaboration uses this source to investigate coherent elastic neutrino-nucleus scattering (CEvNS) with a suite of detectors. To enable precise cross-section measurements, we plan to reduce an estimated 10% uncertainty in our flux calculation associated with the lack of data for  $\pi^\pm$  production from 1 GeV protons on an Hg target. We present here our Geant4 simulation of neutrino production at the SNS and our plans to experimentally normalize this flux with the development of a 670 kg D<sub>2</sub>O detector. Using the precise cross section calculations for neutrino interactions on deuterium, we will dramatically reduce our flux uncertainty.
