DarkSide-50 Results and the Future Liquid Argon Dark Matter Program

Tuesday 30 July 2019 16:00 (17 minutes)

DarkSide uses a dual-phase Liquid Argon Time Projection Chamber to search for WIMP dark matter. The talk will present the latest result on the search for low mass ($M_{WIMP} < 20\text{GeV}/c^2$) and high mass ($M_{WIMP} > 100\text{GeV}/c^2$) WIMPs from the current experiment, DarkSide-50, running since mid 2015 a 50-kg-active-mass TPC, filled with argon from an underground source. The next stage of the Darkside program will be a new generation experiment involving a global collaboration from all the current Argon based experiments. DarkSide-20k, is designed as a 20-tonne fiducial mass TPC with SiPM based photosensors, expected to be free of any instrumental background for an exposure of >100 ton x years. Like its predecessor DarkSide-20k will be housed at the Gran Sasso (LNGS) underground laboratory, and it is expected to attain a WIMP-nucleon cross section exclusion sensitivity of 10^{-47}cm^2 for a WIMP mass of $1\text{TeV}/c^2$ in a 5 yr run. A subsequent objective, towards the end of the next decade, will be the construction of the ultimate detector, ARGO, with a 300 t fiducial mass to push the sensitivity to the neutrino floor region for high mass WIMPs.

The combination of the three experiments part of a single family will cover completely the WIMP hypothesis from $1\text{GeV}/c^2$ to several hundreds of TeV/c^2 masses.
