

Future prospects for Higgs physics at the LHC and beyond

Mario Pelliccioni

INFN Torino

DPF 2019 – Boston

A results explosion!

In last year, big push to update prospects for high luminosity physics program at LHC

A large part of these projections relate to Higgs physics

Intense collaboration between ATLAS and CMS to create coherent picture

For CMS, public results can be found here

<http://cms-results.web.cern.ch/cms-results/public-results/preliminary-results/FTR/index.html>

[FTR-18-011](#) couplings, width, differential cross section

[FTR-18-016](#) $H \rightarrow$ invisible

[FTR-18-017](#) $H \rightarrow \tau\tau$ in MSSM

[FTR-18-019](#) Double Higgs production

[FTR-18-020](#) $t\bar{t}H$, $H \rightarrow \gamma\gamma$ and self-coupling constraints

[FTR-18-035](#) Exotic decays

[FTR-18-040](#) $H \rightarrow ZZ$ at high mass

This talk uses many results from these documents

Systematic uncertainties

This is the crucial aspect of these projections

CMS mostly considering two scenarios:

- **S1**: “Run-2” systematics
 - Independent on integrated luminosity
 - CMS performance unchanged
- **S2**: “YR18” systematics
 - Theory scaled by $\frac{1}{2}$
 - Experimental scaled by $1/\sqrt{L}$
 - With a cut-off to a reasonable expected limit on uncertainty with CMS upgrades

A pinch of pessimism: 13 TeV (but not much different for h_{125})

Limits to systematics at high lumi

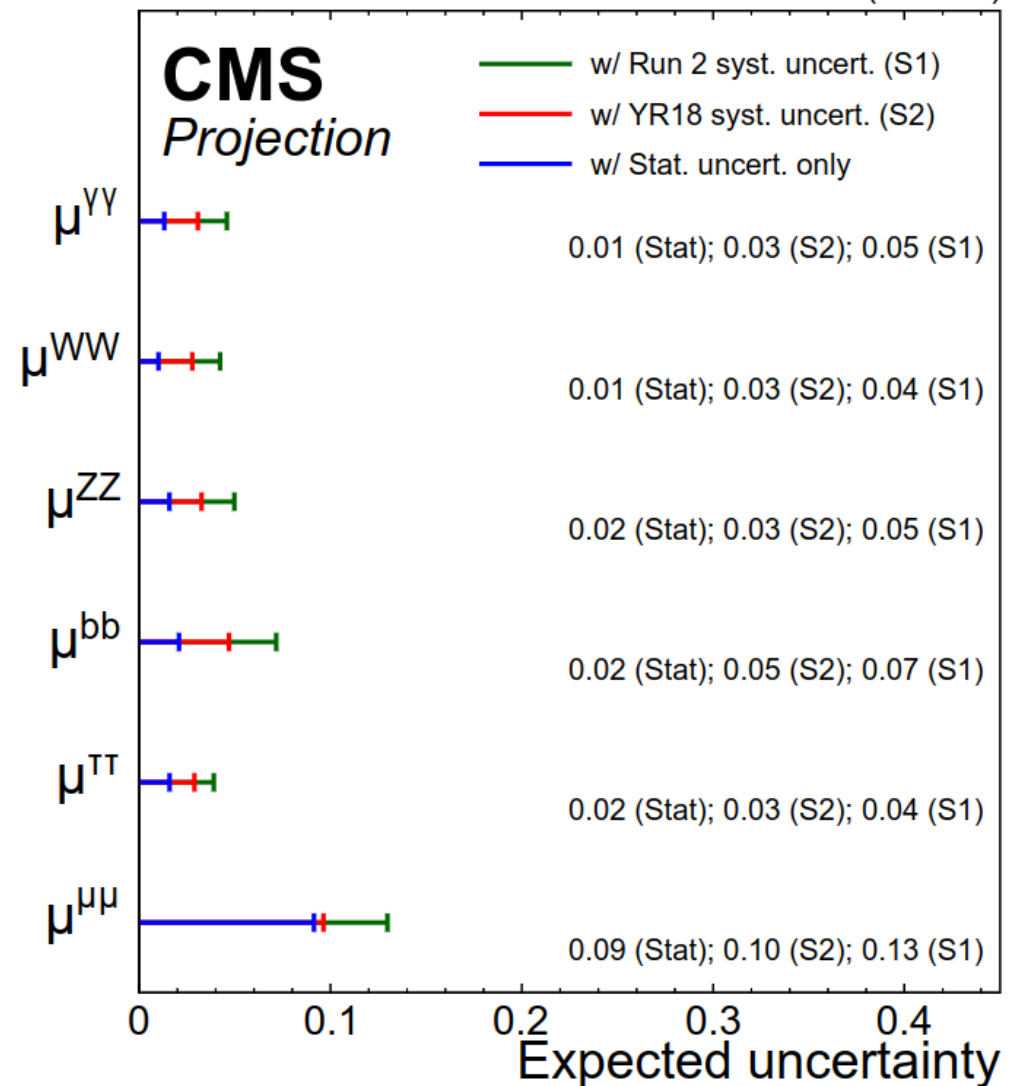

| Source | Component | Run 2 uncertainty | Projection minimum uncertainty |
|------------------|-----------------------|--------------------------------|--------------------------------|
| Muon ID | | 1–2% | 0.5% |
| Electron ID | | 1–2% | 0.5% |
| Photon ID | | 0.5–2% | 0.25–1% |
| Hadronic tau ID | | 6% | 2.5% |
| Jet energy scale | Absolute | 0.5% | 0.1–0.2% |
| | Relative | 0.1–3% | 0.1–0.5% |
| | Pileup | 0–2% | Same as Run 2 |
| | Method and sample | 0.5–5% | No limit |
| | Jet flavour | 1.5% | 0.75% |
| | Time stability | 0.2% | No limit |
| Jet energy res. | | Varies with p_T and η | Half of Run 2 |
| MET scale | | Varies with analysis selection | Half of Run 2 |
| b-Tagging | b-/c-jets (syst.) | Varies with p_T and η | Same as Run 2 |
| | light mis-tag (syst.) | Varies with p_T and η | Same as Run 2 |
| | b-/c-jets (stat.) | Varies with p_T and η | No limit |
| | light mis-tag (stat.) | Varies with p_T and η | No limit |
| Integrated lumi. | | 2.5% | 1% |

Signal strength: decay modes

$$\mu = \frac{\sigma_{meas}}{\sigma_{SM}}$$

300 fb⁻¹ (13 TeV)

3000 fb⁻¹ (13 TeV)

With 3 ab⁻¹, systematics are the limiting factor for *most* of the final states

Not really a surprise, but...

Systematics: theory vs experiment

Target of few % uncertainty at end of LHC seems feasible in S2

Theory uncertainties become dominant at high lumi (apart from $\mu\mu$)

Beware: high correlations arise at 3 ab⁻¹

Signal strength: production channels

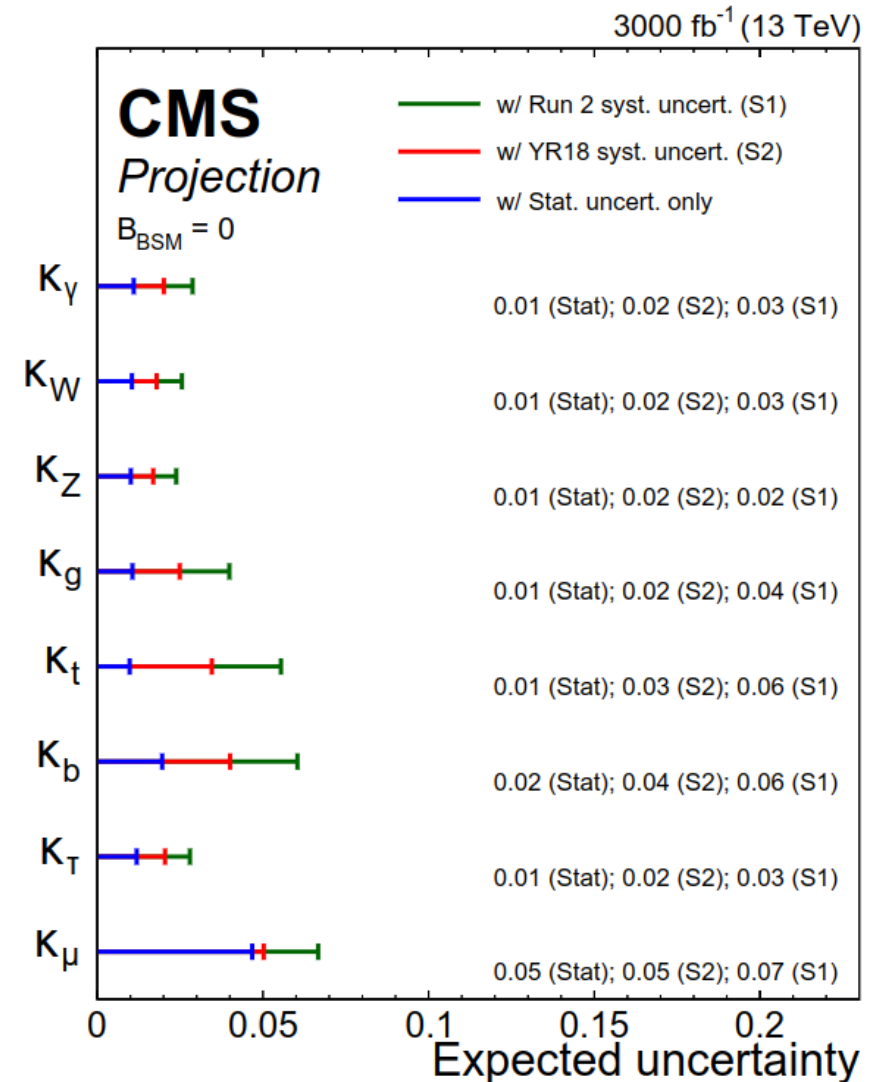

$$\mu = \frac{\sigma_{meas}}{\sigma_{SM}}$$

At 3 ab⁻¹, still statistically limited in all but ggH and ttH
 This information on signal strength can be further processed...

Higgs coupling modifiers

$$K = \frac{g_{meas}}{g_{SM}}$$

All coupling uncertainties with a few % at 3 ab⁻¹

Muon coupling < 10% in both scenarios

“Signal theory” generally the largest uncertainty at 3 ab⁻¹

Caveat: larger correlations wrt signal strength

Reminder: quark/lepton couplings within 2nd/3rd families crucial for NP searches..

Differential cross sections

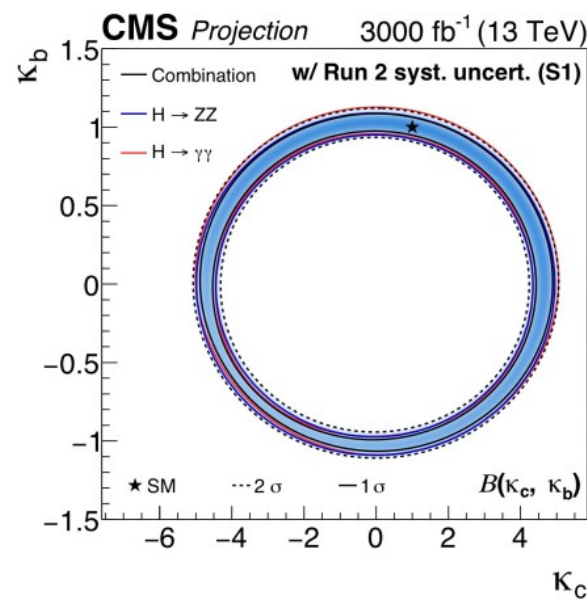

Main conclusions:

- At 3 ab⁻¹ uncertainties reduced by factor 10 wrt now
- Higher p_T bins still statistically Dominated
- Lower p_T bins theory limited

Can use the p_T distribution to
Constrain couplings: (b,c) or (g,t)

Additional information that can be
used in a global fit

Higgs width

Remind: direct measurement “impossible” at LHC

Workaround: measure the ratio between on-shell and off-shell cross sections

→ Only one depends on Γ_H , and great reduction of systematics

CMS in $H \rightarrow VV$

→ Current limit is 9 MeV @ 95% CL

Still statistically limited

Caveat: *assumptions...*

One can also put limits on anomalous couplings

H \rightarrow invisible

Projections to 3 ab⁻¹ show search **limited by systematic** uncertainties

Not the biggest surprise: tough analysis in pp environment, with great experimental challenges

Interesting exercise:

Test scenario with missing mass resolution worse by factor 2

- Case of *extreme* PU conditions

Conclusion:

Analysis is flexible enough to yield similar limits with selection re-optimization

Di-Higgs production

H-H production naturally emerges from the Standard Model

Potential near minimum:

$$V^{SM}(h) = \frac{m_h^2}{2} h^2 + \lambda_3^{SM} v h^3 + \lambda_4^{SM} h^4$$

$m_H \rightarrow$ mass term

$\lambda_3 = \frac{m_H^2}{2v}$ Trilinear self-coupling

$\lambda_4 = \frac{m_H^2}{8v^2}$ Quartic self-coupling

H-H production at LHC

In SM, typically non-resonant

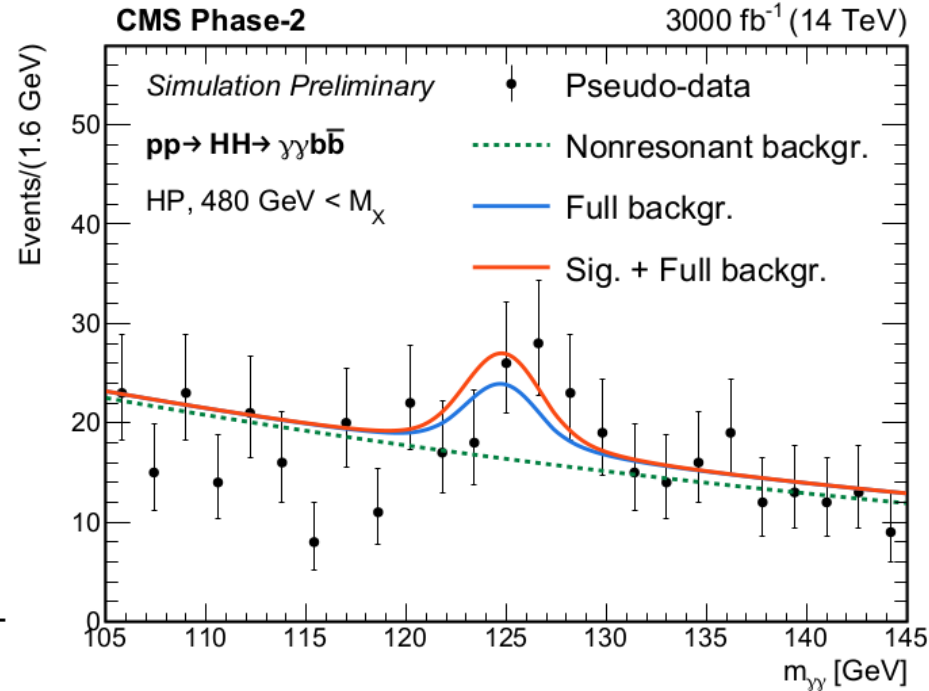

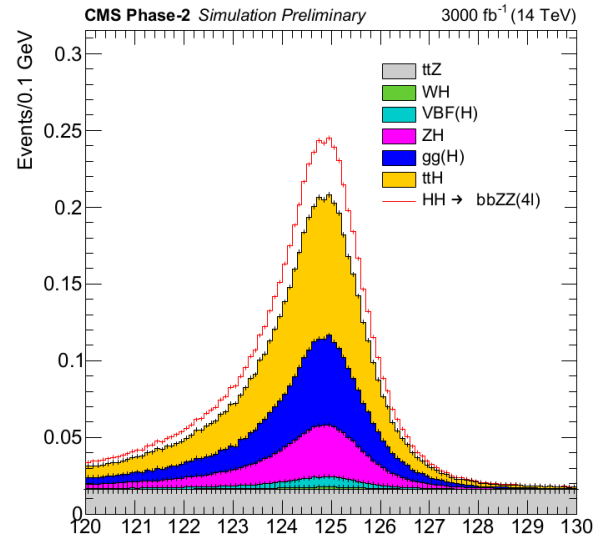

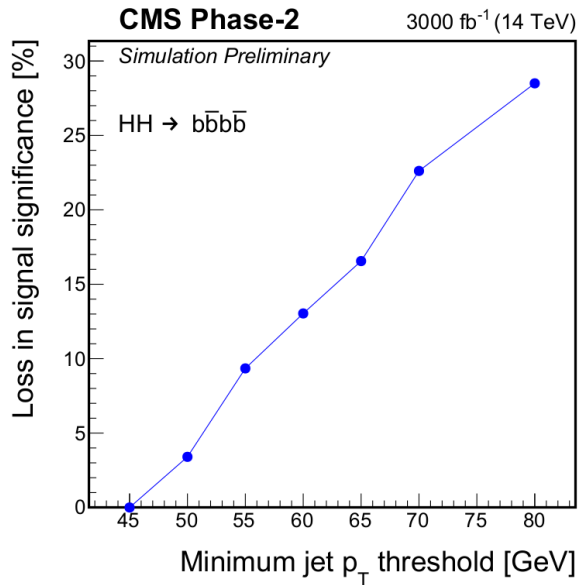

Nature doesn't help: destructive interference

NP can be resonant or non-resonant (expansion on higher dim operators)

A plethora of final states

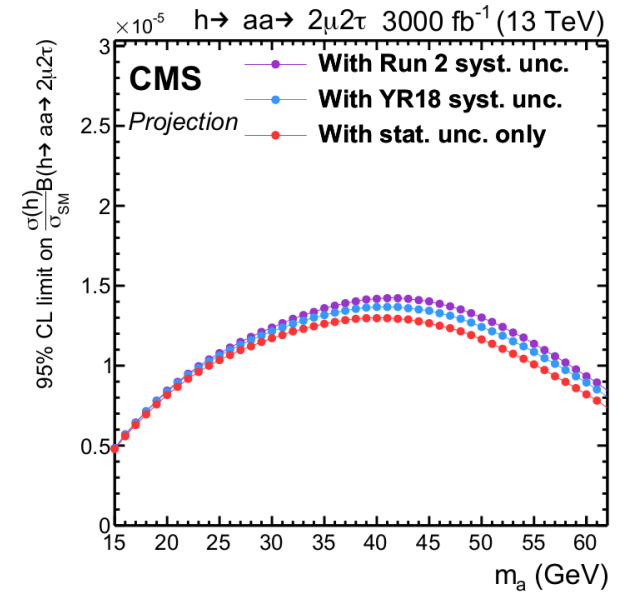

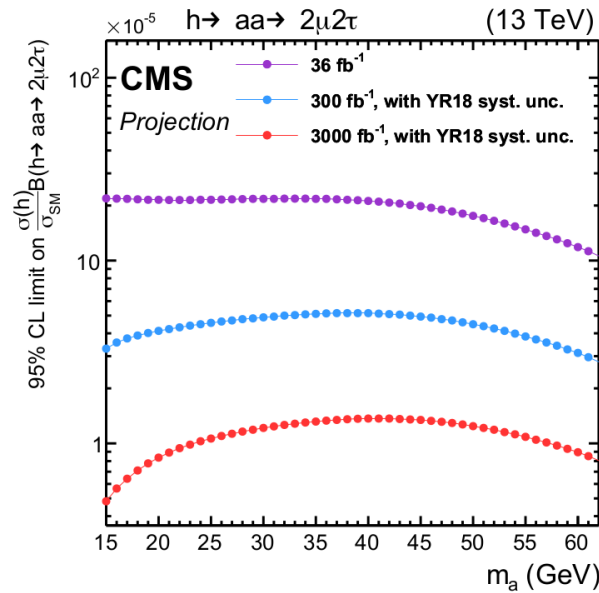

| Channel | Significance | | 95% CL limit on $\sigma_{HH}/\sigma_{HH}^{SM}$ | |
|-------------|---------------|------------|--|------------|
| | Stat. + syst. | Stat. only | Stat. + syst. | Stat. only |
| bbbb | 0.95 | 1.2 | 2.1 | 1.6 |
| bbττ | 1.4 | 1.6 | 1.4 | 1.3 |
| bbWW(lνlν) | 0.56 | 0.59 | 3.5 | 3.3 |
| bbγγ | 1.8 | 1.8 | 1.1 | 1.1 |
| bbZZ(llll) | 0.37 | 0.37 | 6.6 | 6.5 |
| Combination | 2.6 | 2.8 | 0.77 | 0.71 |

Combination shows LHC won't provide a complete picture on di-Higgs physics

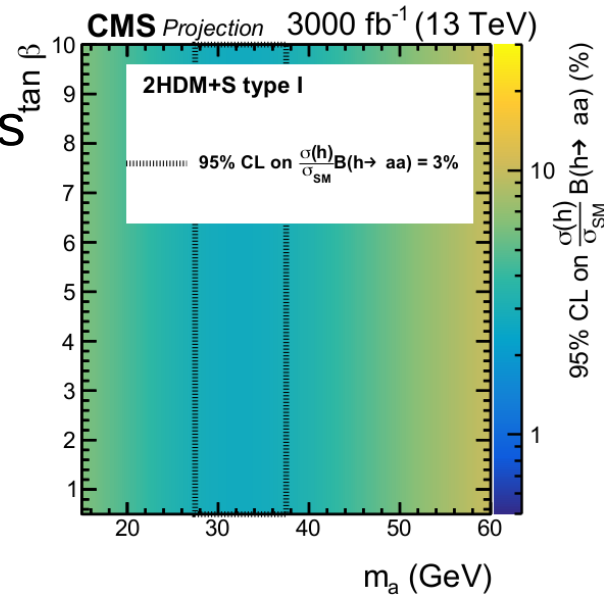

Exotic decays

- Lots of possible decays to be studied at HL-LHC

- $H \rightarrow \text{meson} + \gamma$
- $H \rightarrow \text{quarkonium}$
- $H \rightarrow aa$
- $H \rightarrow hh, Zh, Ah$
- LFV

- For now, projections mostly for light pseudoscalar searches
- Some analyses need to be re-thought for HL environment

Higgs at future colliders

Studies emerging to provide more complete view on Higgs perspectives in future colliders

Fundamental step into decision making process for next generation accelerators

Many scenarios, difficult to summarize all considerations

Di-Higgs: cubic self-coupling

from arXiv:1905.03764

Conclusions

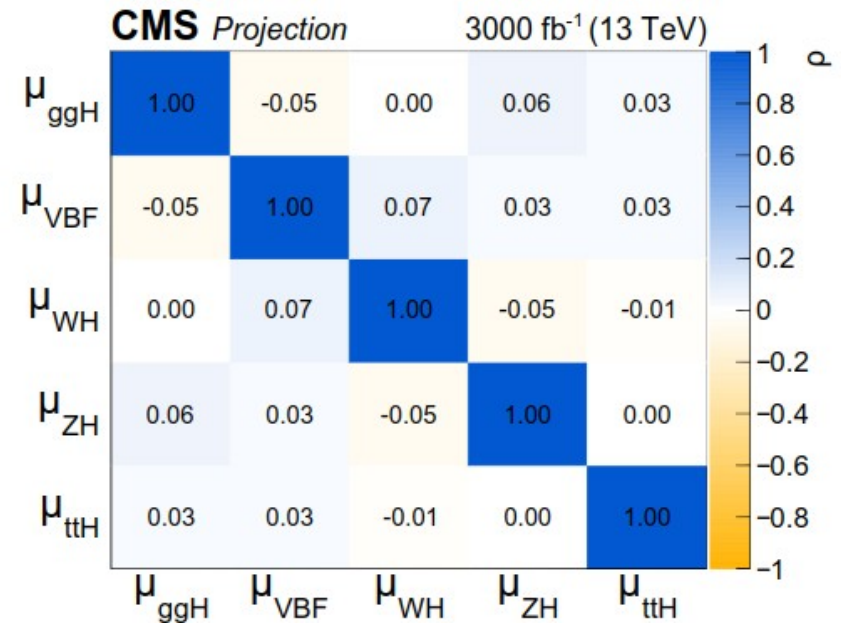

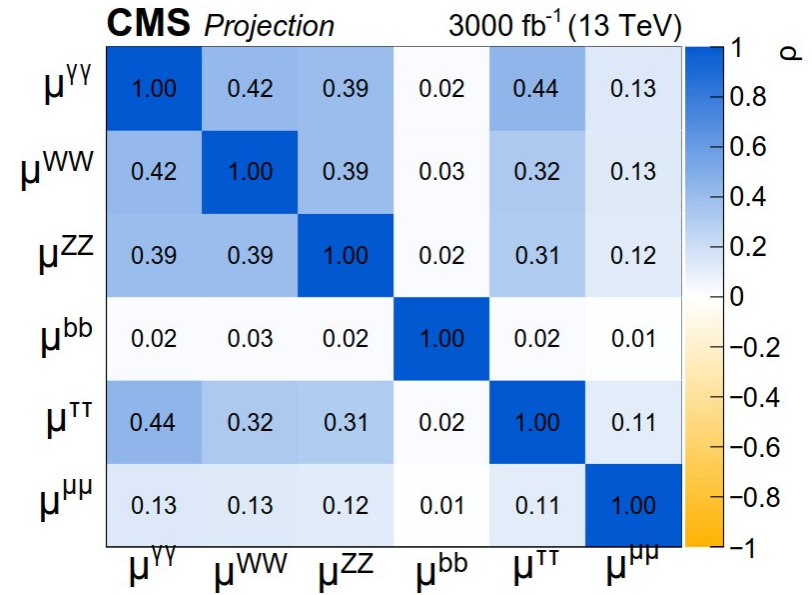

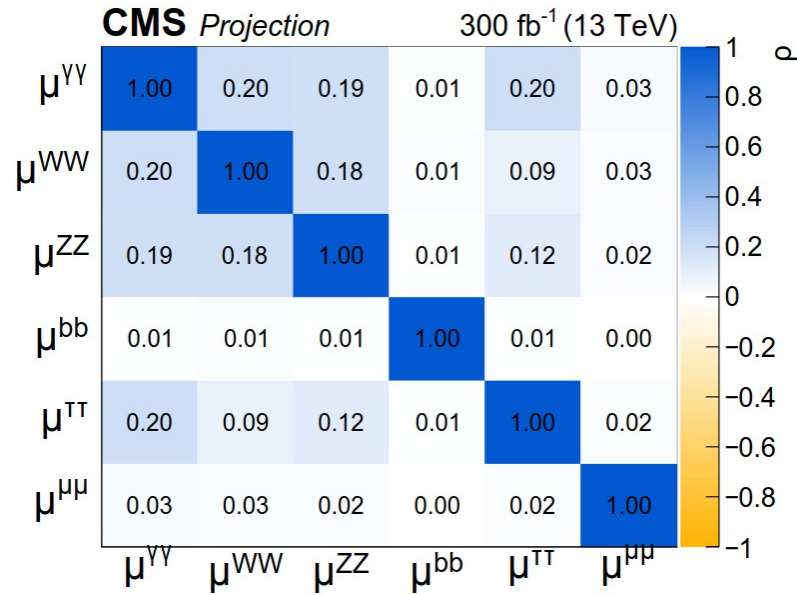

- CMS on track to provide coherent view on Higgs perspectives during the lifetime of the experiment
- Capitalized on Run-II experience
 - What are the critical areas?
 - Where will theory uncert. *hit us the most?*
 - Cross-collaboration dialogue with theory community fundamental
 - Positive message: in some way, we are always pessimistic
 - Difficult to account for new ideas

Single-Higgs physics will see it's natural conclusion at LHC with a 3 ab^{-1} dataset

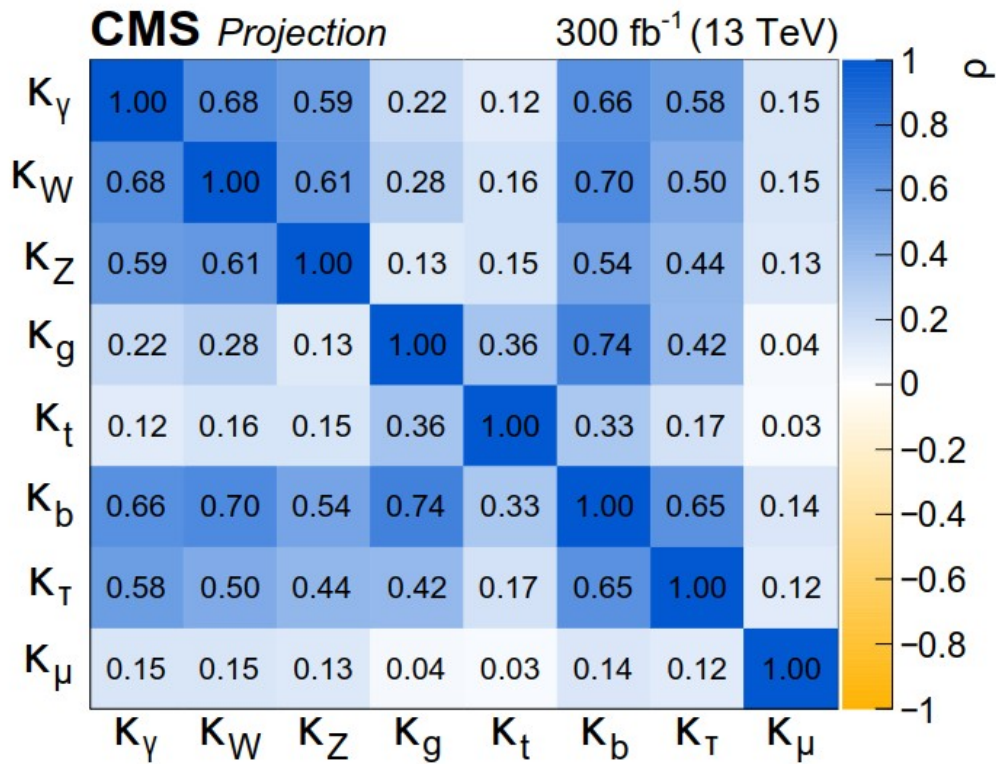

Double-Higgs physics will require a new project...!
