DPF 2019, 8/1/2019

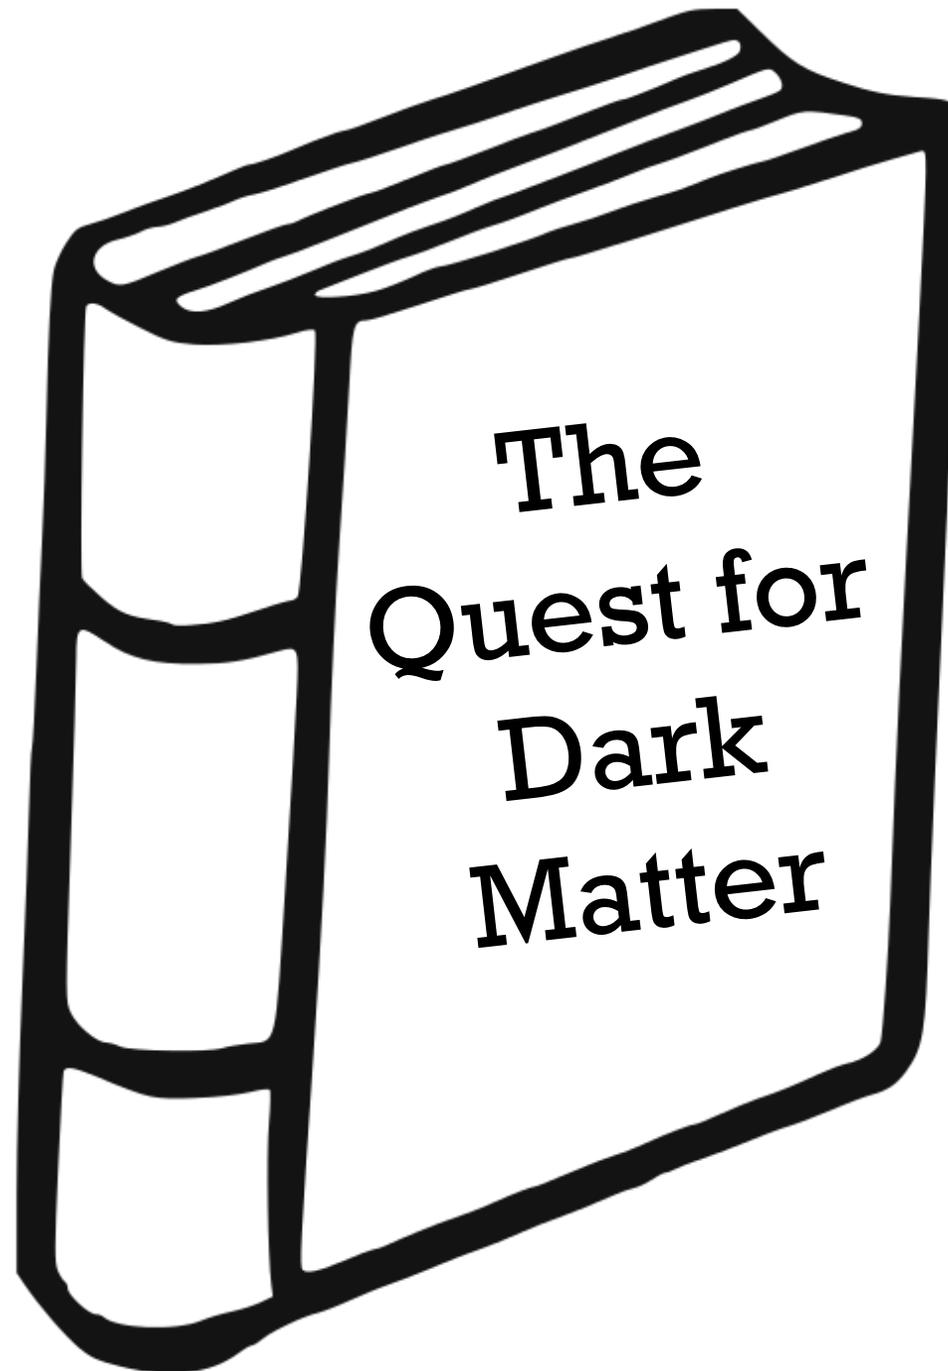

Disclaimer

You're probably tired...it's Day 4, after Lunch...

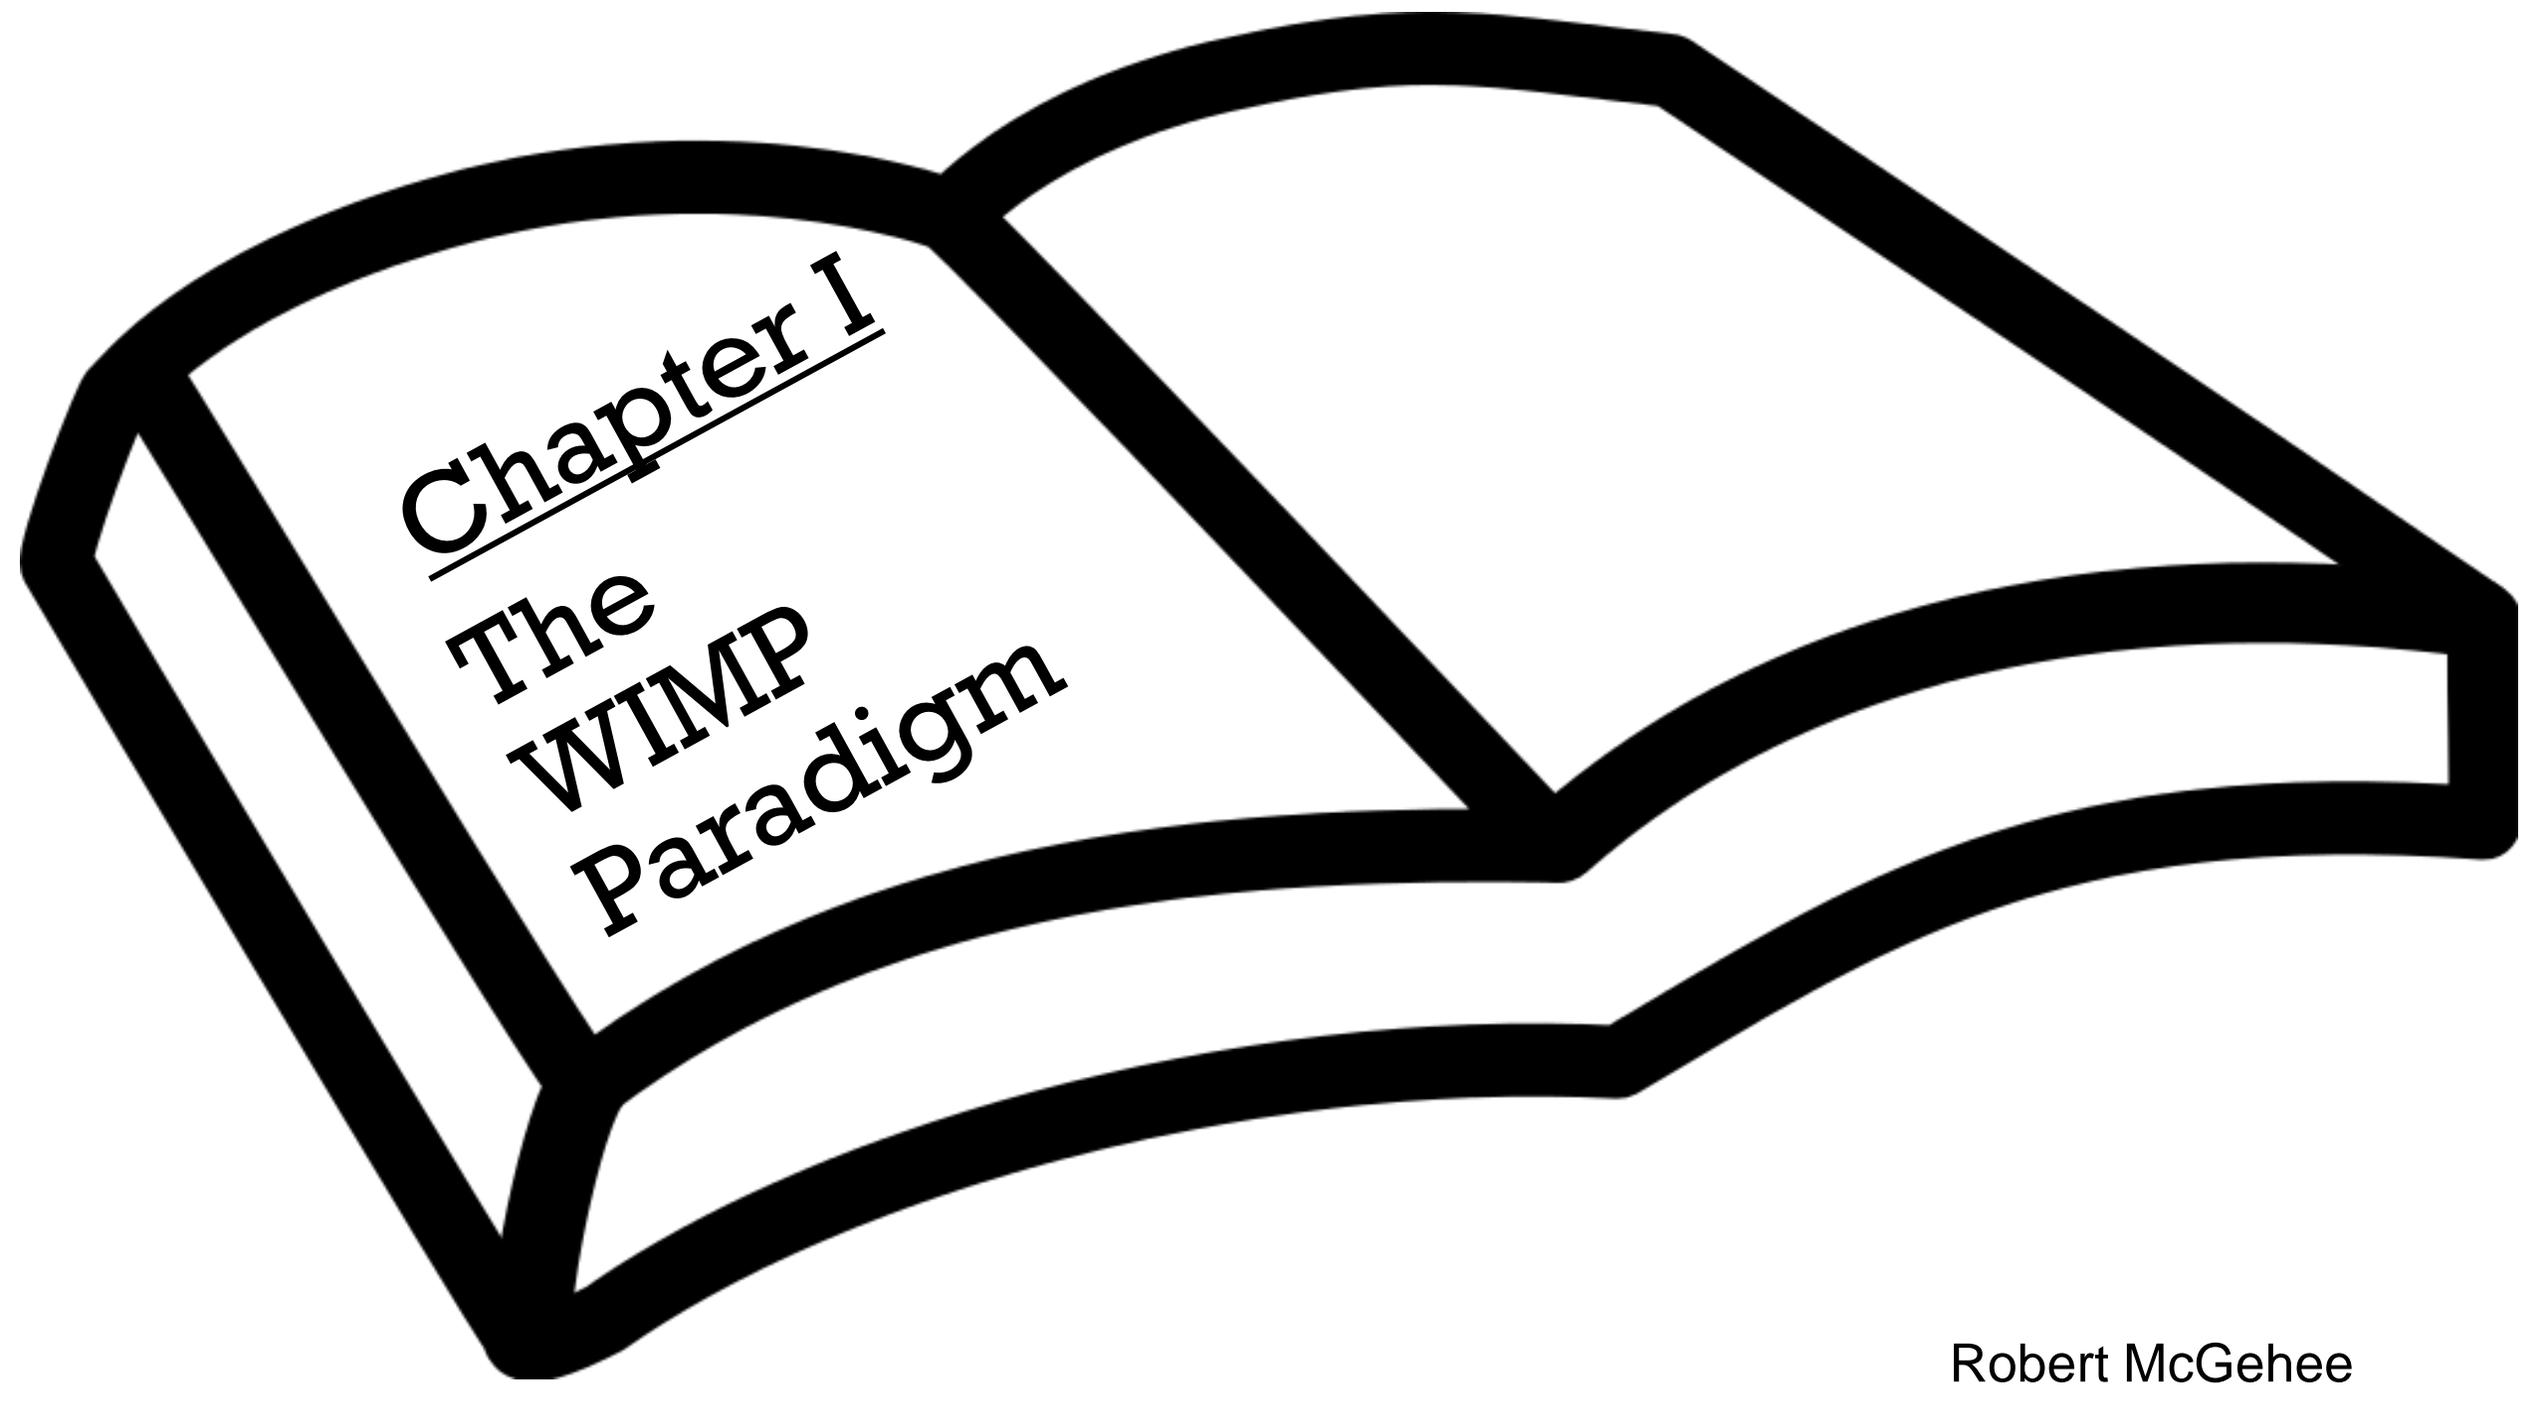

My promises to you:

- This slide has **by far** the most text (besides the summary).
 - I'll start my talk with story time!
 - There's not a single equation!
 - I've hidden a picture of Einstein!

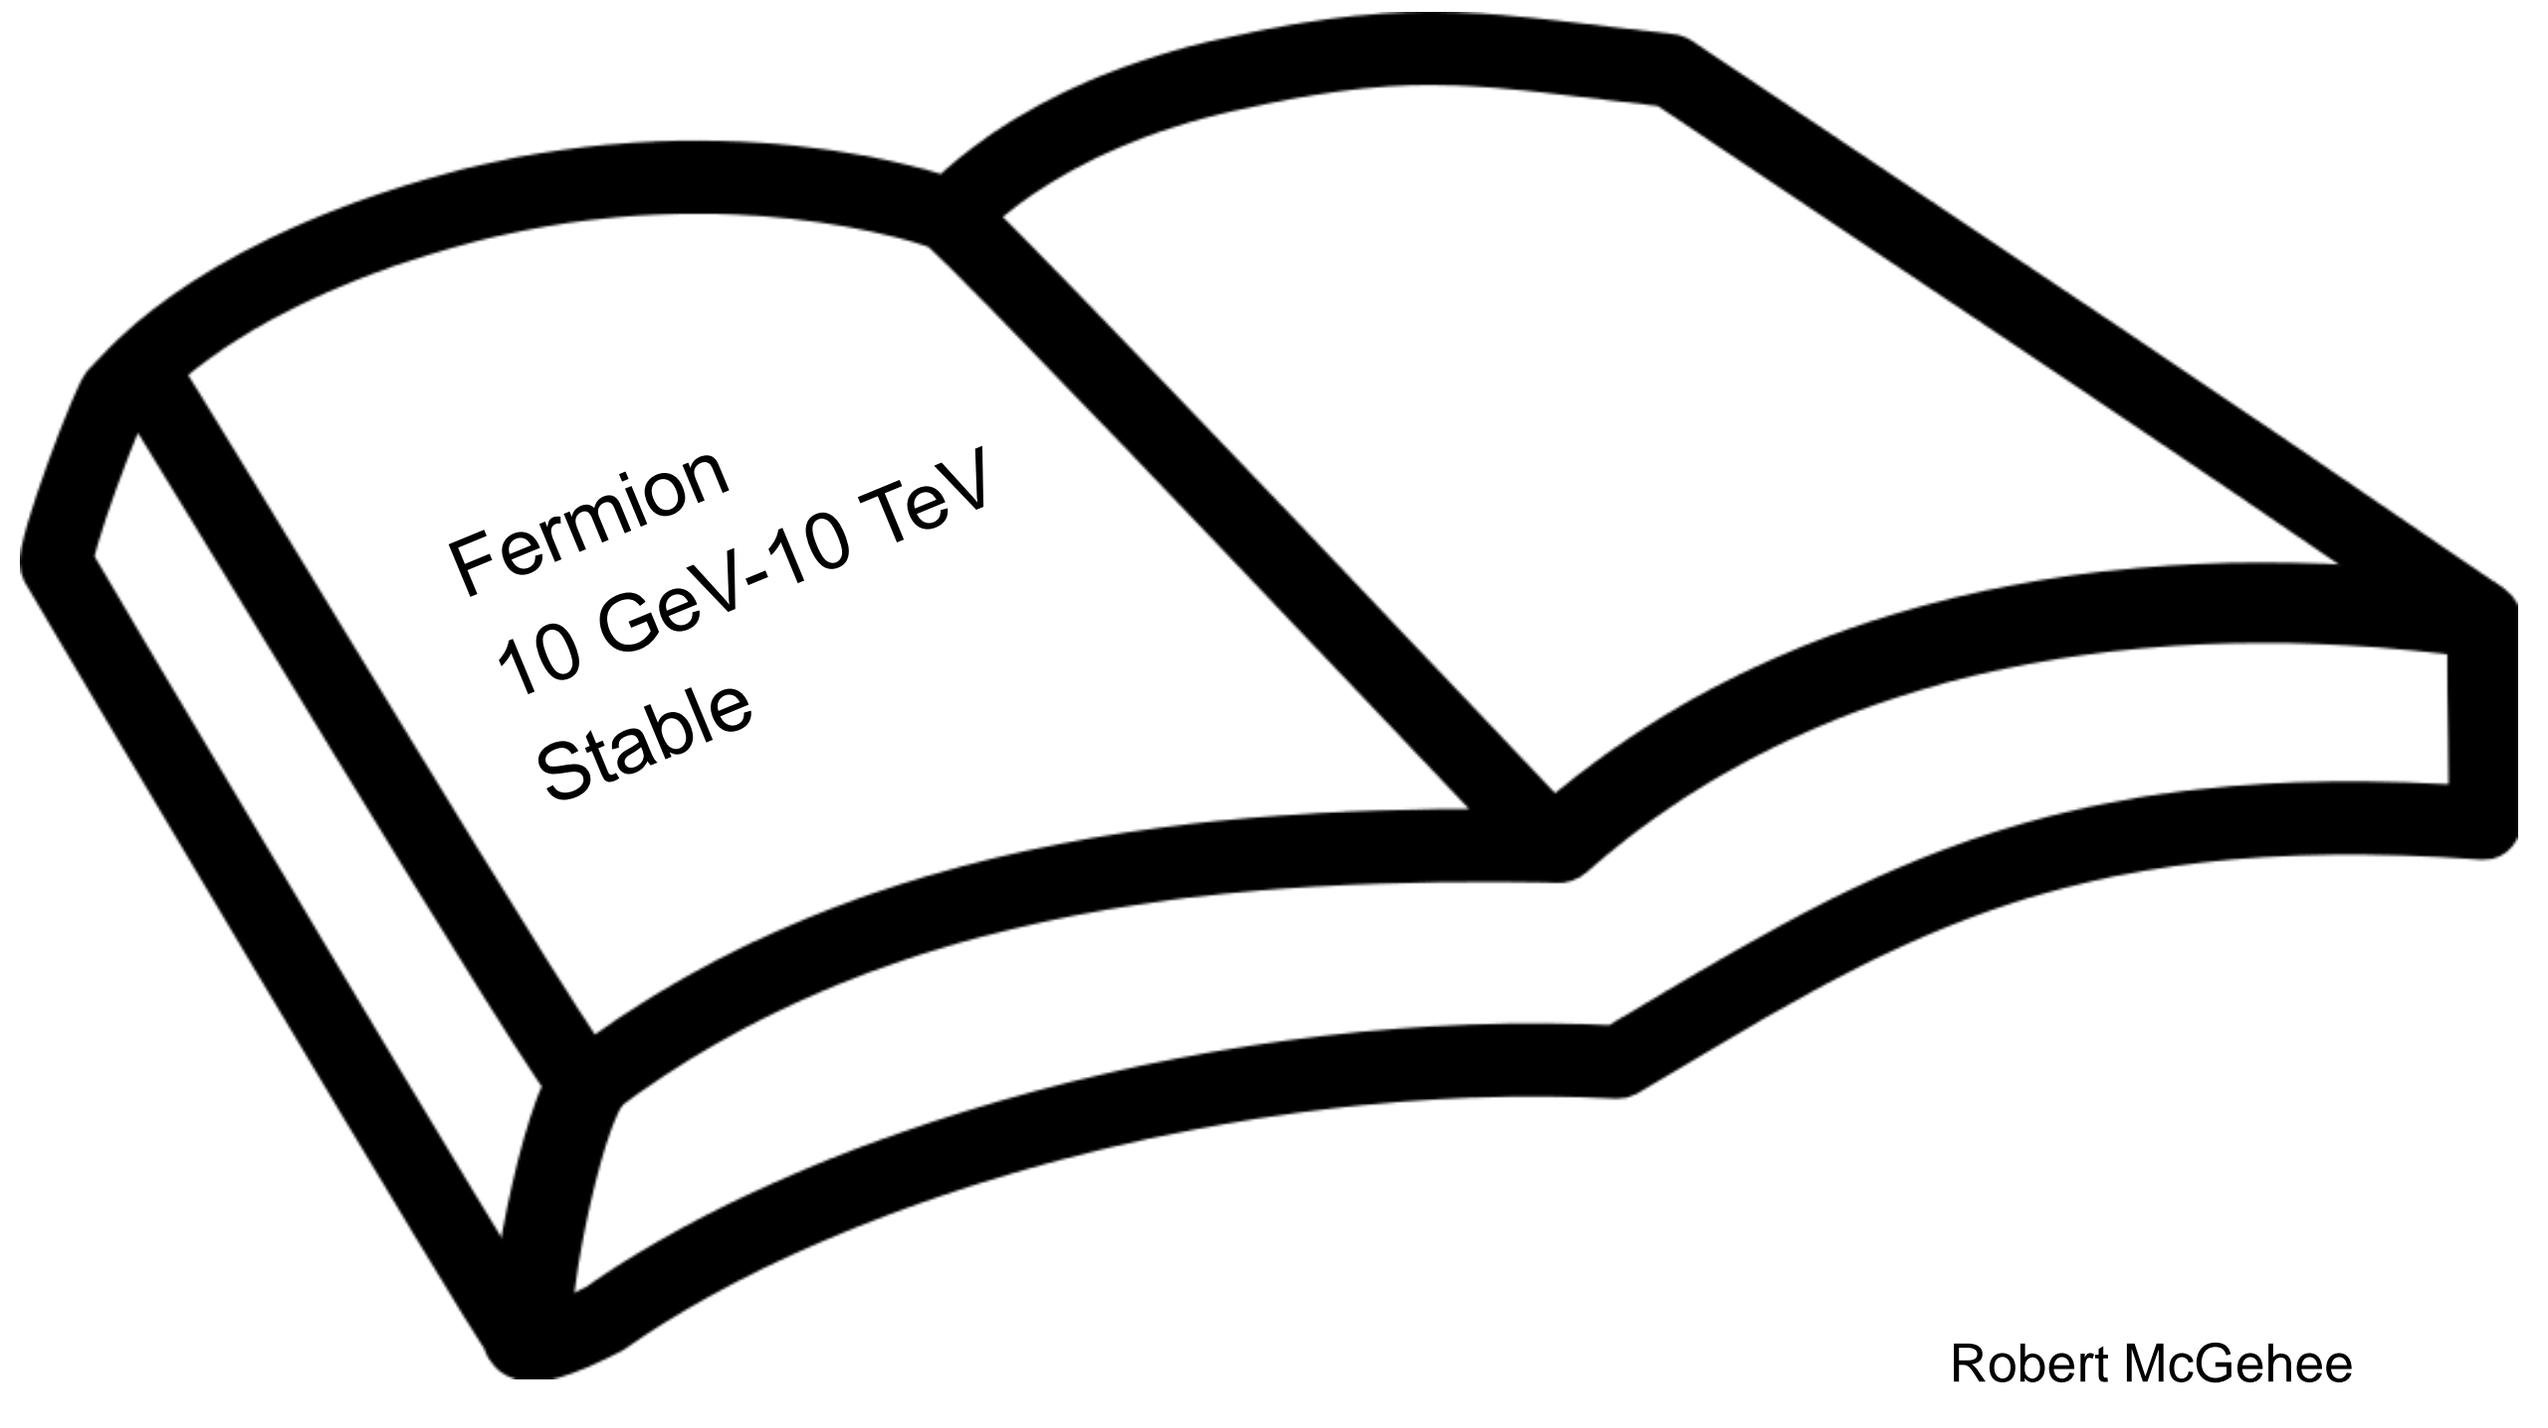

**The
Quest for
Dark
Matter**

Robert McGehee

A stylized black outline of an open book. The left page contains the text 'Chapter I' underlined, followed by 'The WIMP Paradigm' in three lines. The right page is blank. The book is shown from a perspective that is slightly angled to the right.

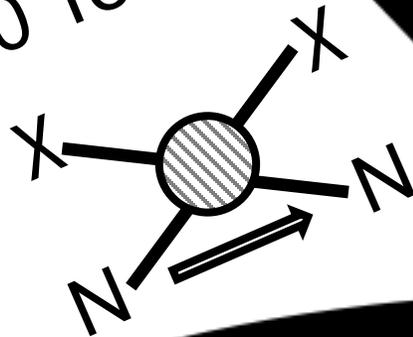

Chapter I

The
WIMP
Paradigm

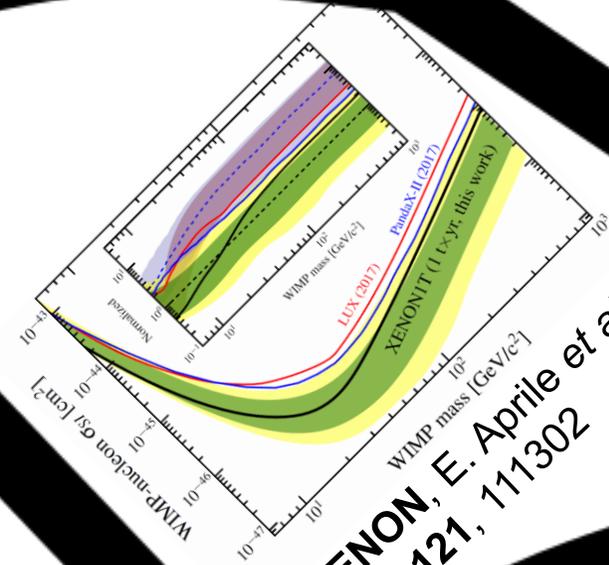

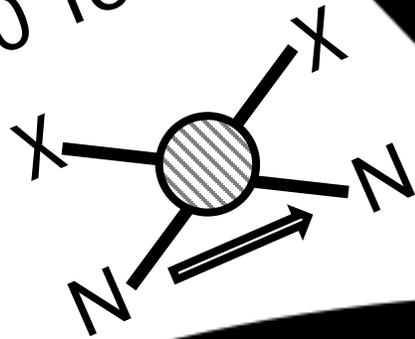

A thick black line drawing of a book, shown from a three-quarter perspective. The book is open, with the cover on the left and the pages on the right. The cover has text on it. The pages are represented by several curved lines, suggesting the thickness of the book. The drawing is simple and stylized, using only black lines on a white background.

“Charged Current” Induced β^- Decays

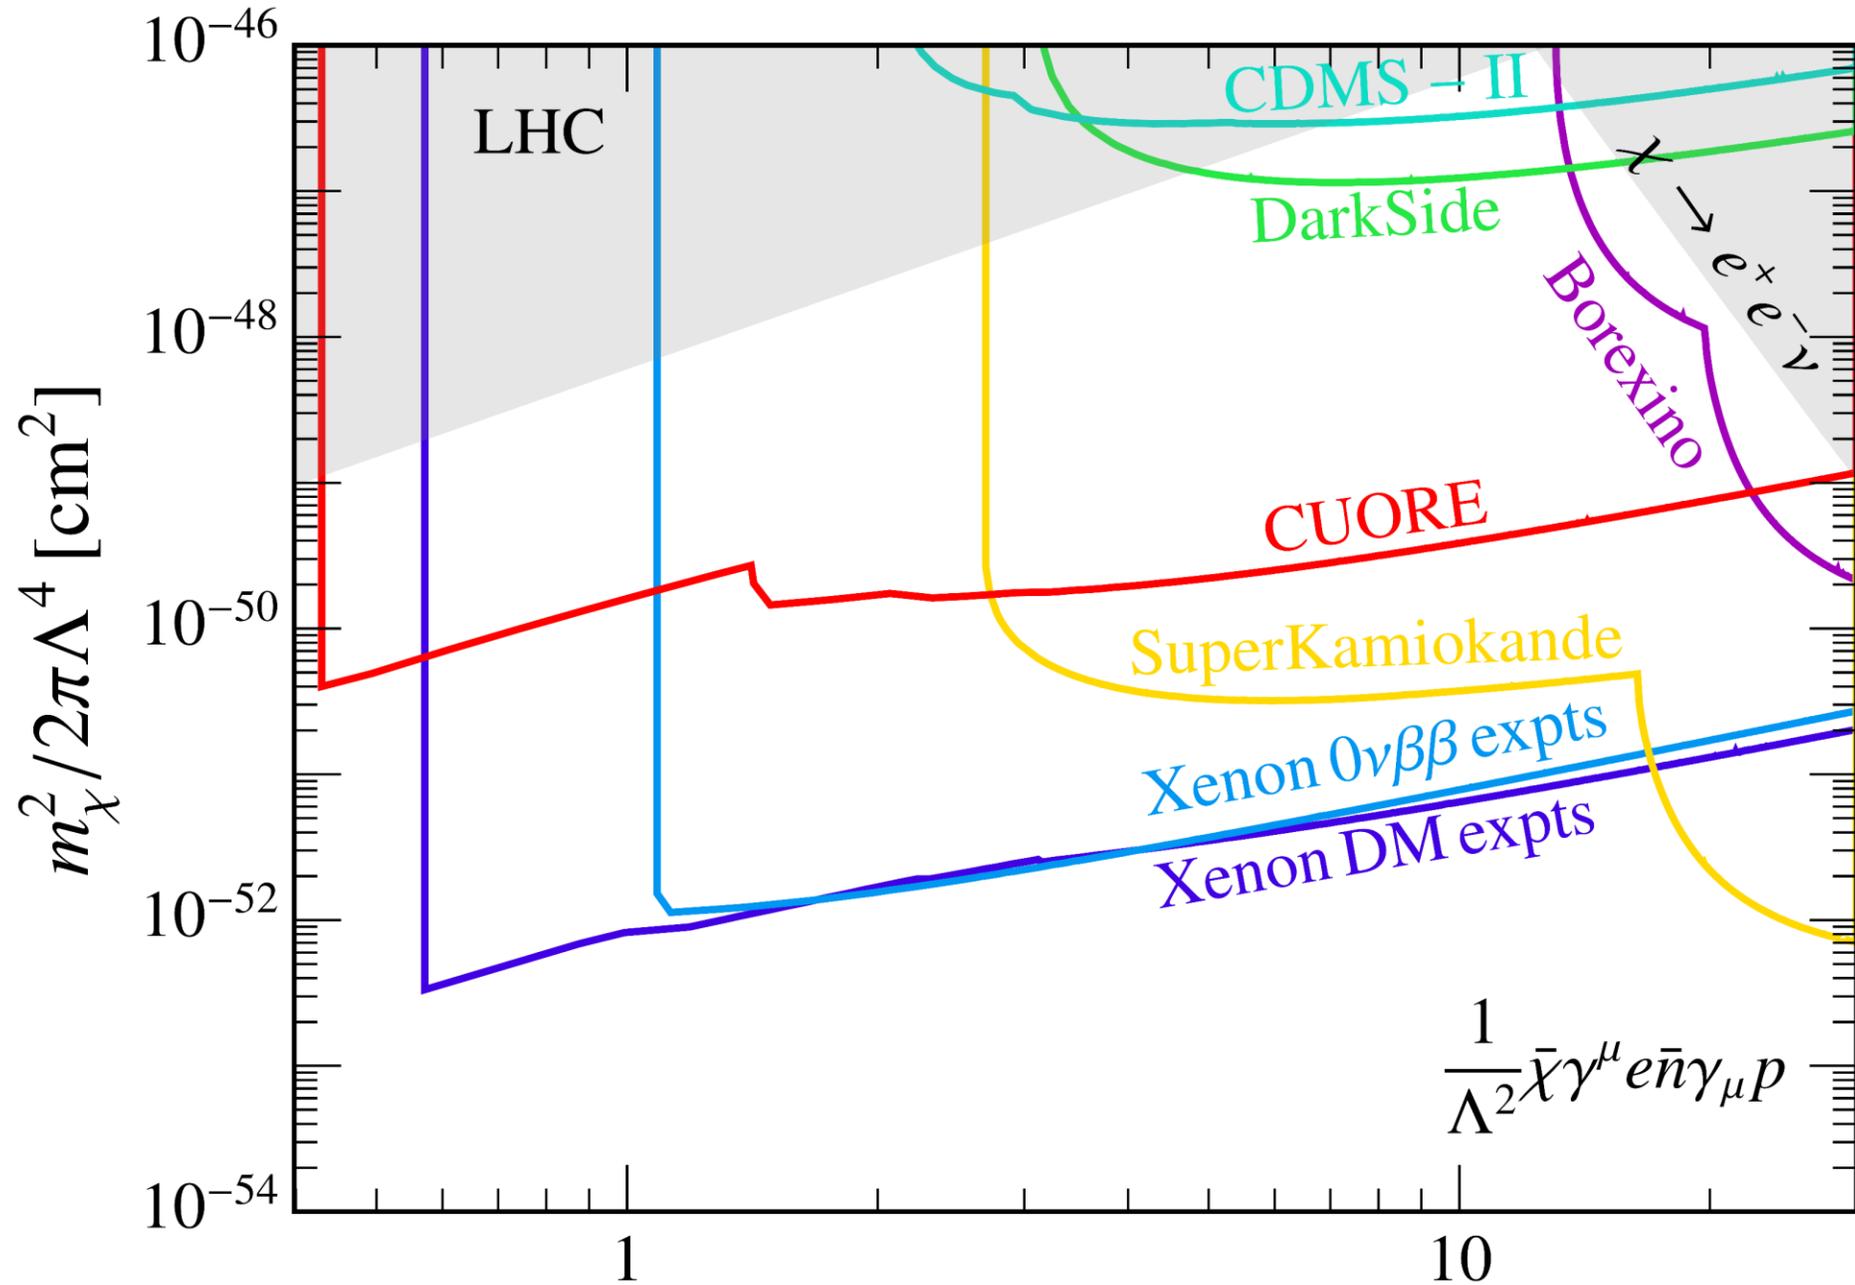

• e^- !

• NR!

• γ !

• N' Decay!

Summary

Relaxing DM stability assumptions allows for novel signals and operators.

Neutral current operators yield peaked, correlated nuclear recoil (NR) signals.

Charged current operators yield β^- , NR, and γ signals.

New searches at existing experiments can probe both neutral and charged current operators.

Fermionic DM absorption is an exciting playground for both experiments and model building!
