## 2019 Meeting of the Division of Particles & Fields of the American Physical Society

Contribution ID: 437 Type: Oral Presentation

## **Electroweak Symmetric Dark Matter Balls**

Monday 29 July 2019 16:51 (17 minutes)

We show that a simple Higgs-portal dark matter model can contain stable non-topological soliton states of dark matter. This macroscopic dark matter candidate has its interior in an electroweak symmetry unbroken vacuum. They can have its radius around the atomic scale and mass as large as  $10^{26}$  GeV. We discuss the formation of these dark matter balls from the first order electroweak phase transition in the early universe. Such dark matter candidates can be searched in a wide range of experiments, we provide constraints from WIMP-like direct detection and also from multi-scattering events in large volume liquid scintillator neutrino detectors, ancient mica and also Xenon-1T.

Authors: BAI, Yang (University of Wisconsin, Madison); PONTON, Eduardo; JAIN, Bithika (ICTP-SAIFR)

Presenter: JAIN, Bithika (ICTP-SAIFR)

Session Classification: Dark Matter

Track Classification: Dark Matter
