## 2019 Meeting of the Division of Particles & Fields of the American Physical Society

Contribution ID: 205

Type: Oral Presentation

## Combined Neyman-Pearson Chi-square: an improved approximation to the Poisson-likelihood chi-square

Tuesday 30 July 2019 14:20 (20 minutes)

We present a new method to approximate the widely-used Poisson-likelihood chi-square using a linear combination of Neyman's and Pearson's chi-squares, namely "combined Neyman-Pearson chi-square" (CNP). Through analytical derivation and toy model simulations, we show that CNP leads to a significantly smaller bias on the best-fit normalization parameter compared to that using either Neyman's or Pearson's chi-square. When the computational cost of using the Poisson-likelihood chi-square is high, CNP provides a good alternative given its natural connection to the covariance matrix formalism.
