

Biomarkers from an experimental point of view

Siamak Haghdoost, PhD, Radiobiology
University of Caen, Cimap/Laria, France

Biomarker:

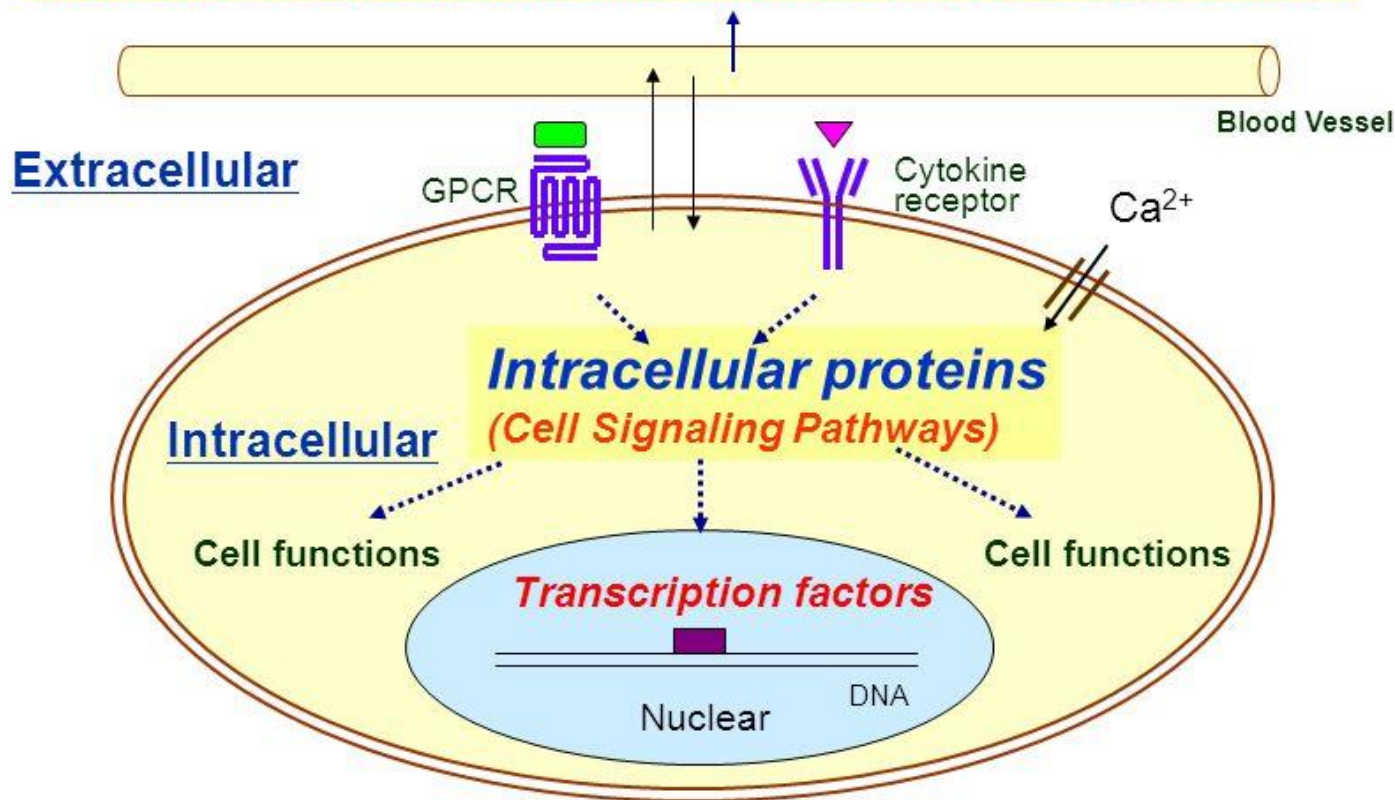

Any measurement reflecting an interaction between a biological system and an environmental agent, which may be chemical, physical or biological.

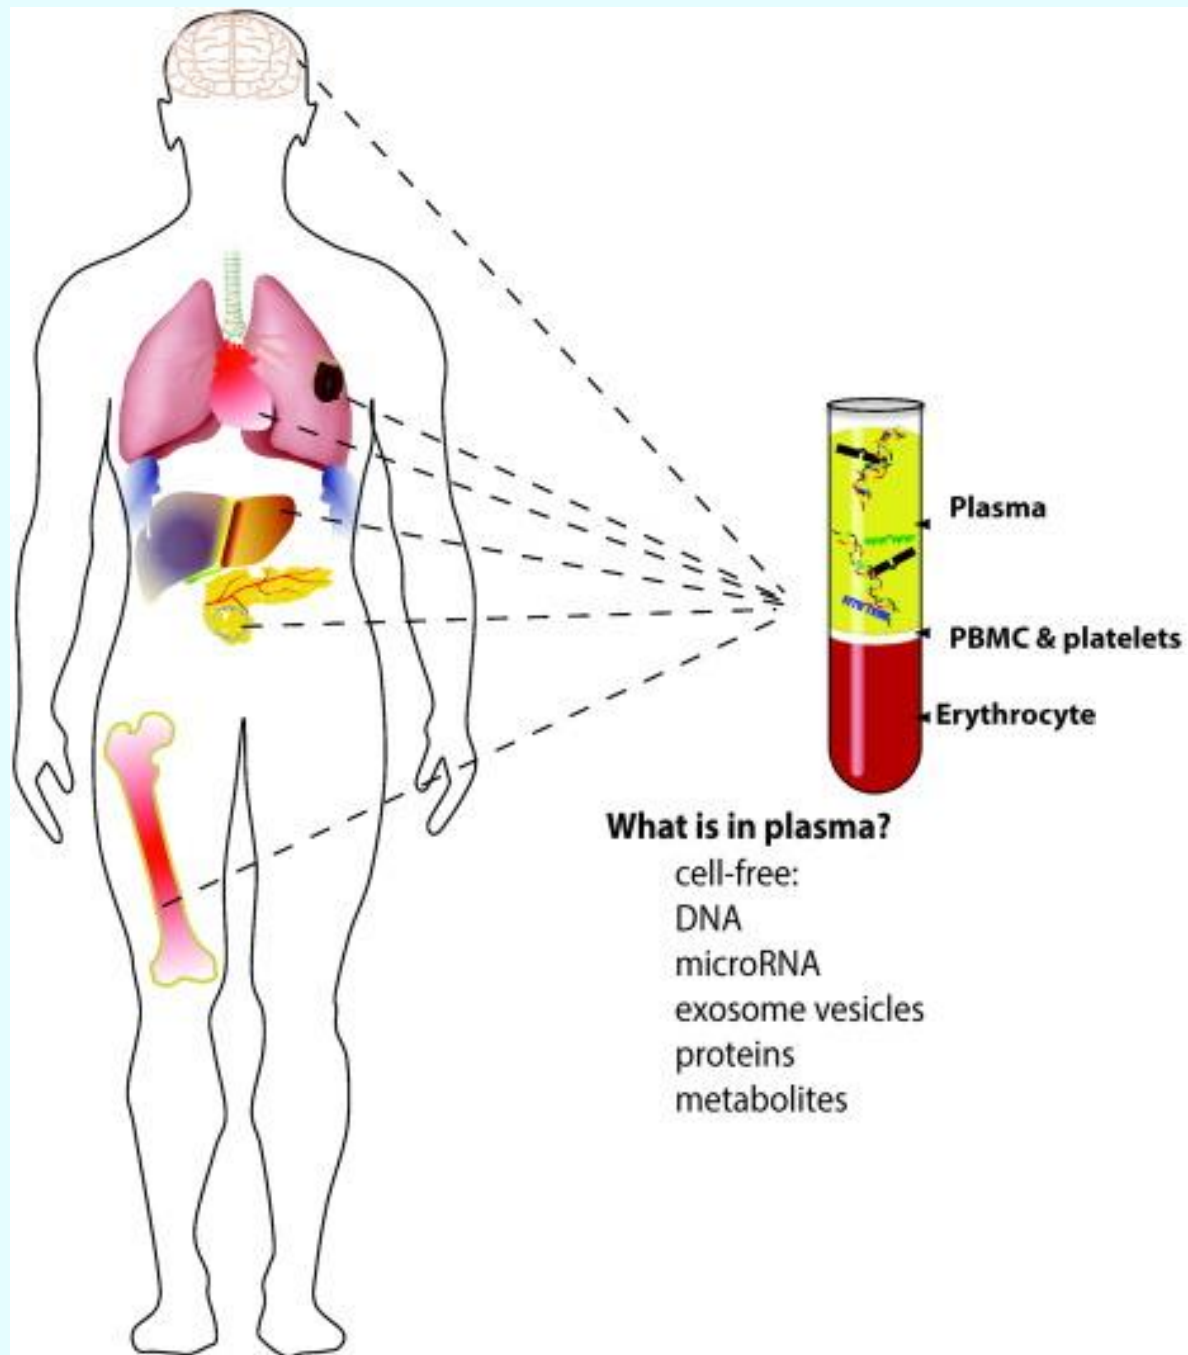

Considering radiation:

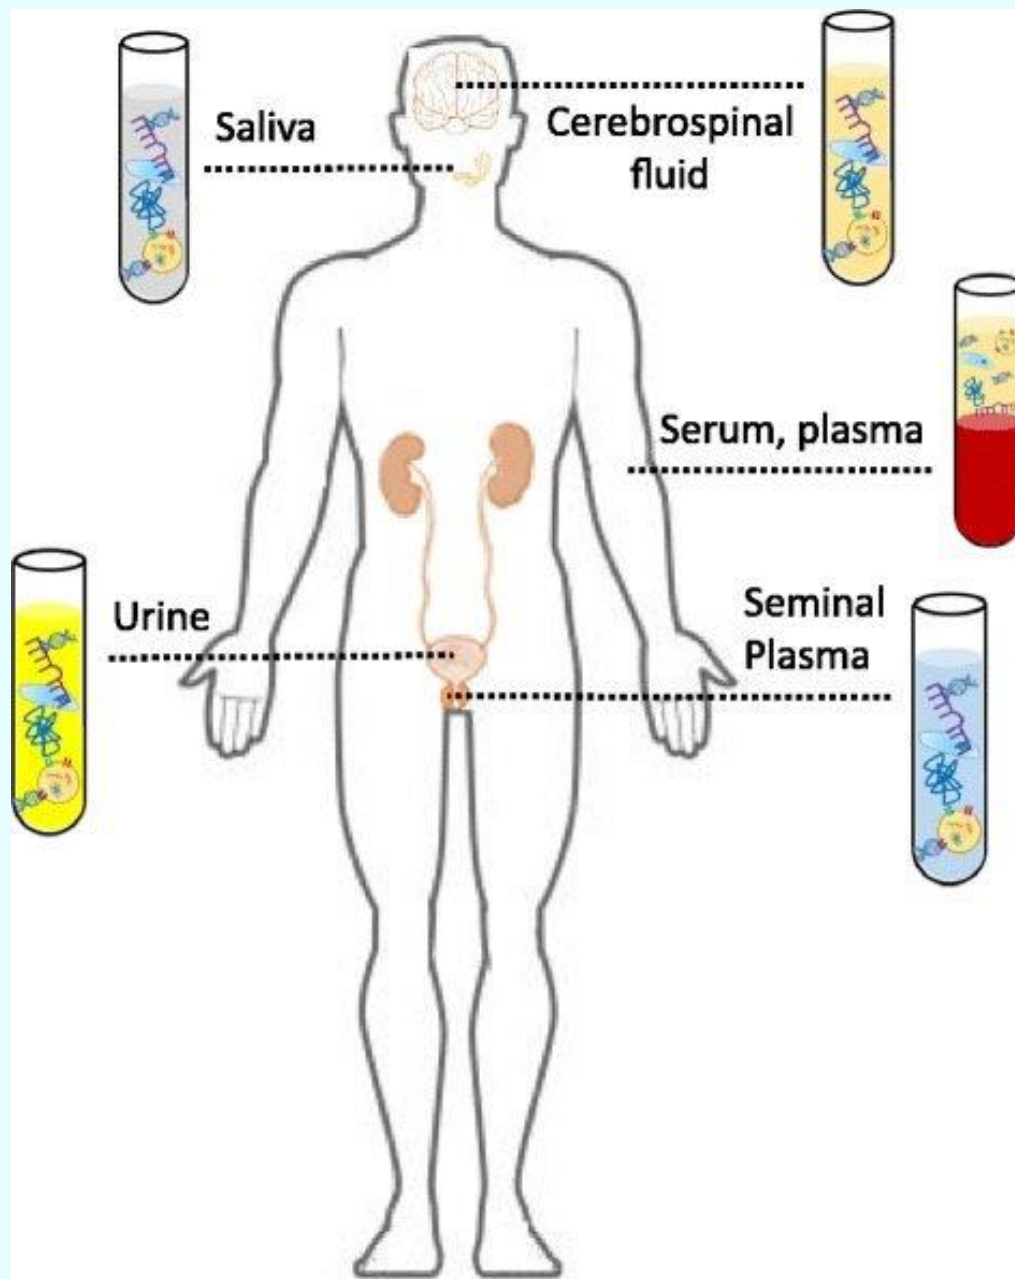

- Biomarkers can be used for multiple purposes:
 - Estimation or validation of received dose
 - Investigation of correlation between exposure and biological responses e.g., therapeutic effects of radiotherapy
 - Investigation of individual susceptibility
 - Early detection of a radiation induced health effect

Circulating Biomarkers

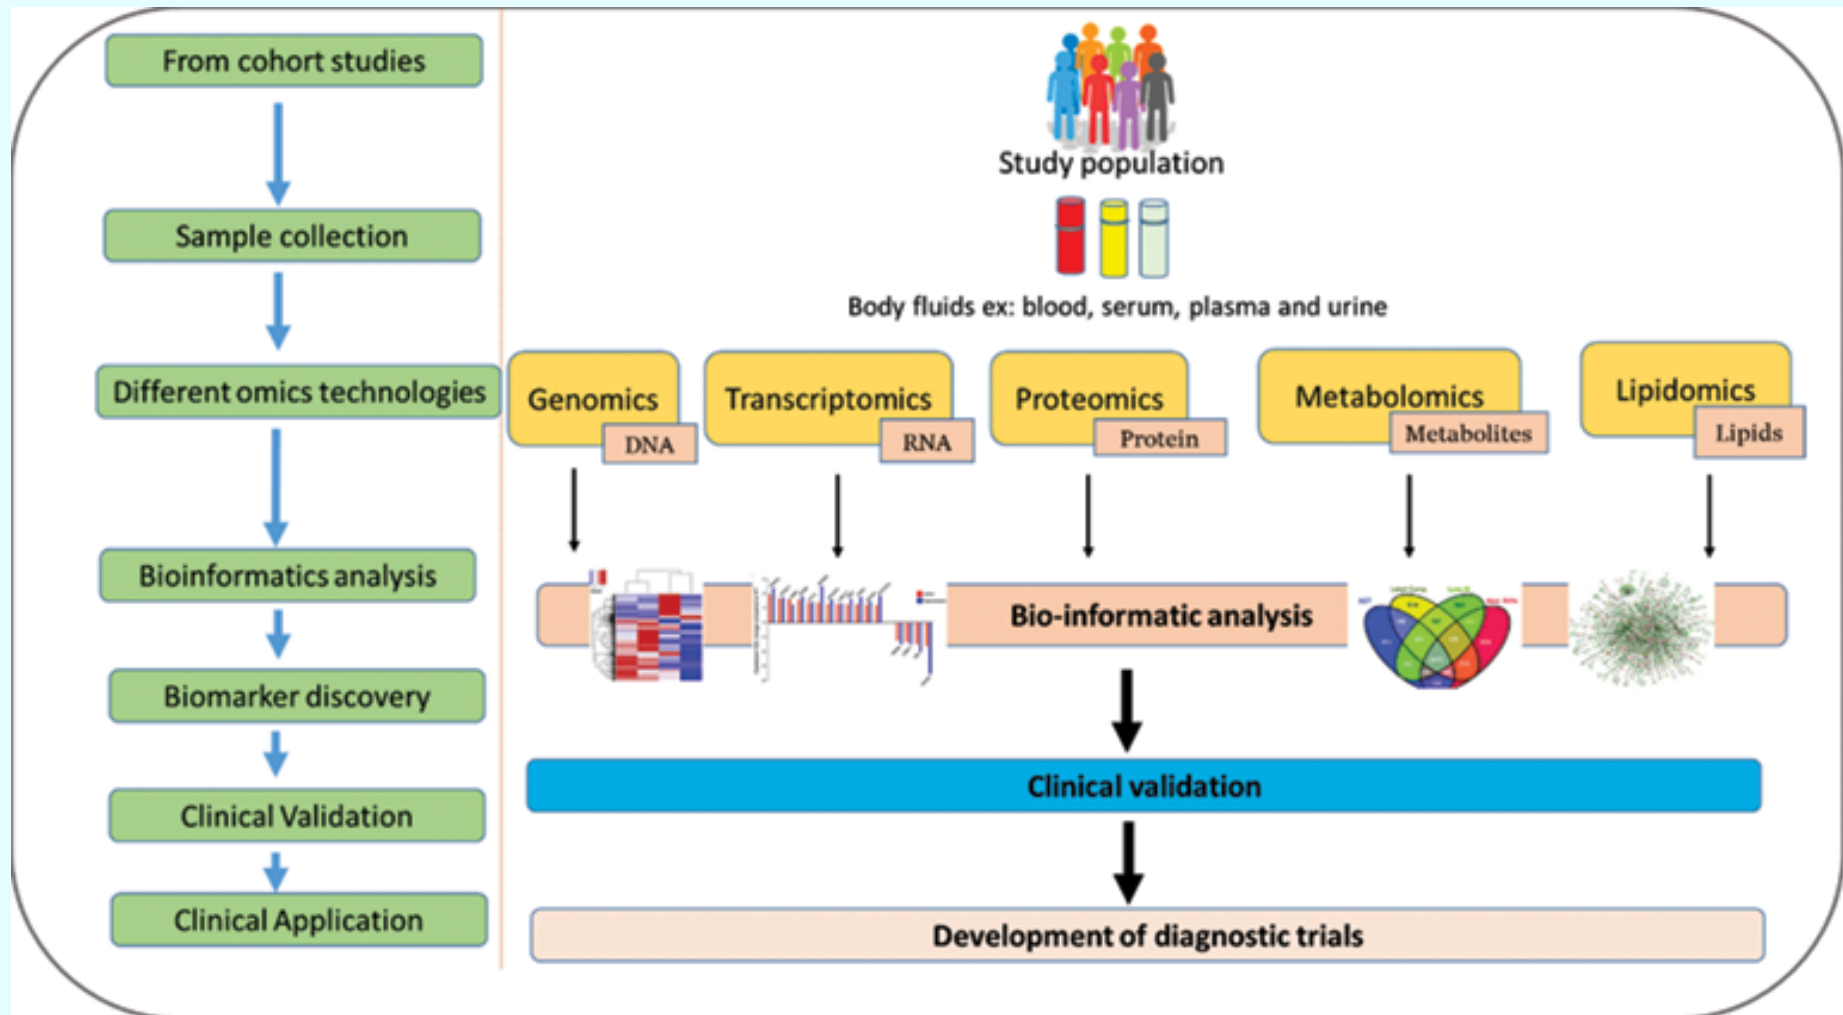

(Metabolic Diseases, Inflammation/ Immunology, Oncology, Neuroscience, Toxicity)

Retrospective or prospective cohorts

Example of biomarker for monitoring
effect of treatment:

Serum level of thymidine kinase 1

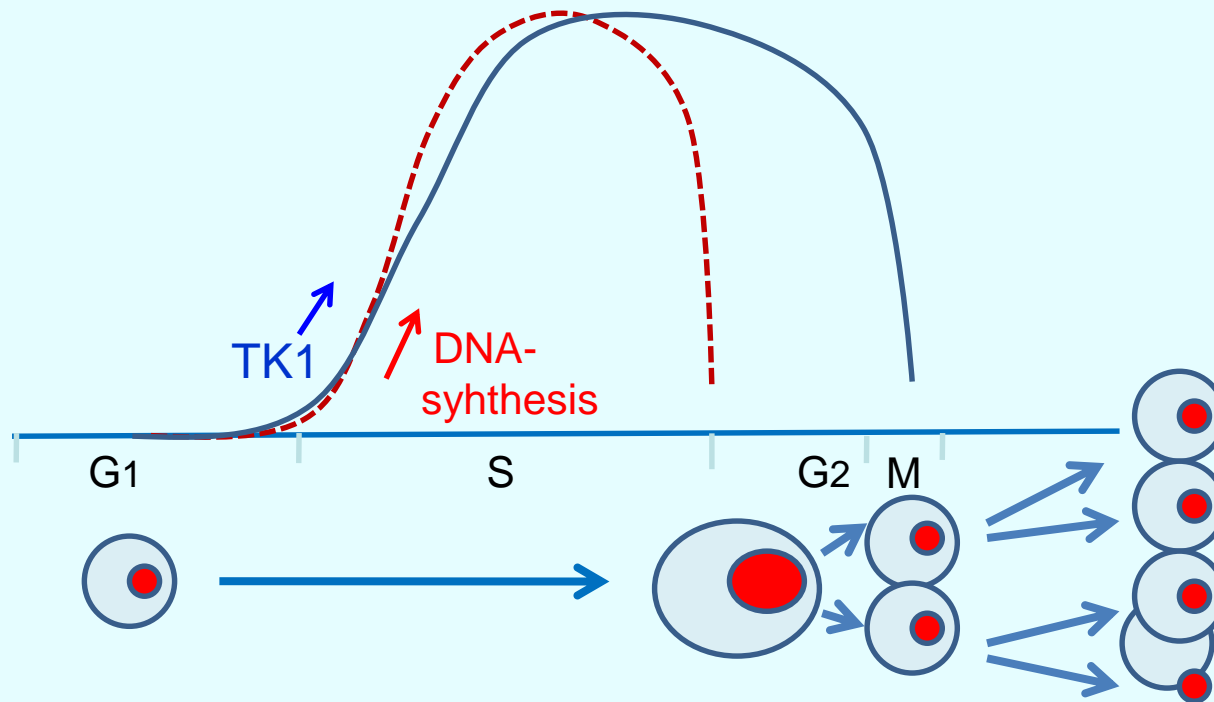

1951: TK1 was discovered by Prof Peter Richard and his research group

Late 1954: TK1 was suggested as a proliferation/growth marker in tumour biopsy

1986 – 2000: developed a sensitive TK1 test for detect of TK1 in human blood serum

2002: SSTK company was set up to produce TK1 kit

TK1 in relation to DNA-synthesis and the cell cycle

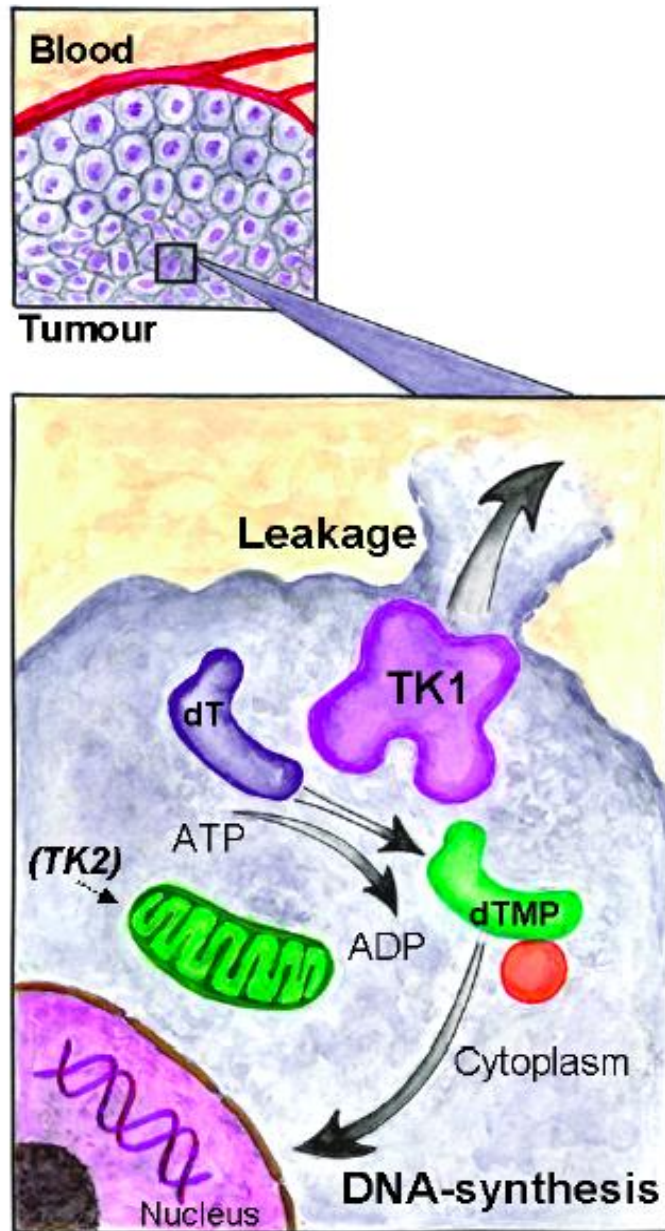

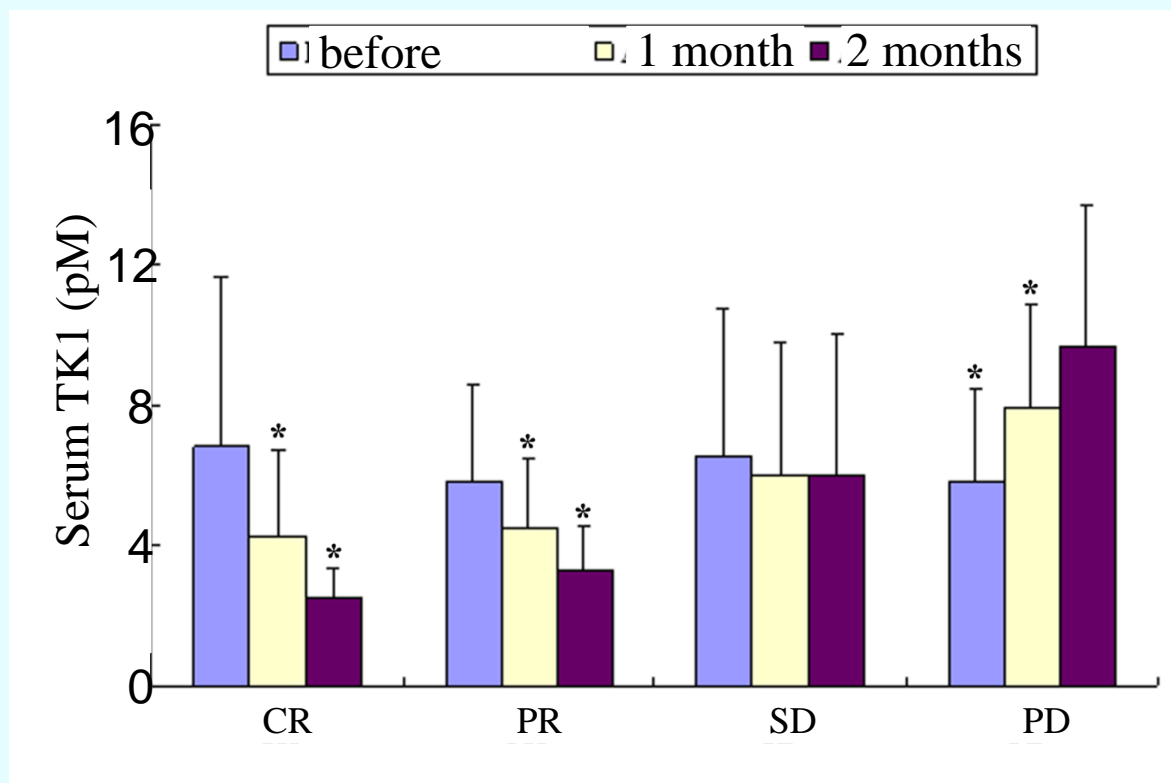

Fig 1

Gastric, monitoring chemo-therapy

CR: complete remission,
 PR: partial remission, 50% of tumor disappear.
 SD: stable diseases, the tumor size did not change.
 PD: progressive diseases, tumor size increase.

Breast cancer survival
Hodgkin disease
Prostate cancer

Colorectal, survival

504 patients

STK1

1. Prognosis of patient survival: High or low levels before treatment
2. Early diagnosis of Relapse: Increase level after treatment indicate relapse
3. Results of treatment: Decreasing level after treatment
4. Health screening of pre-tumor and early small tumor
(low TK1 value, good prognosis)

Healthy tissue reaction in radiotherapy

Increasing incidence
due to long-term survivors

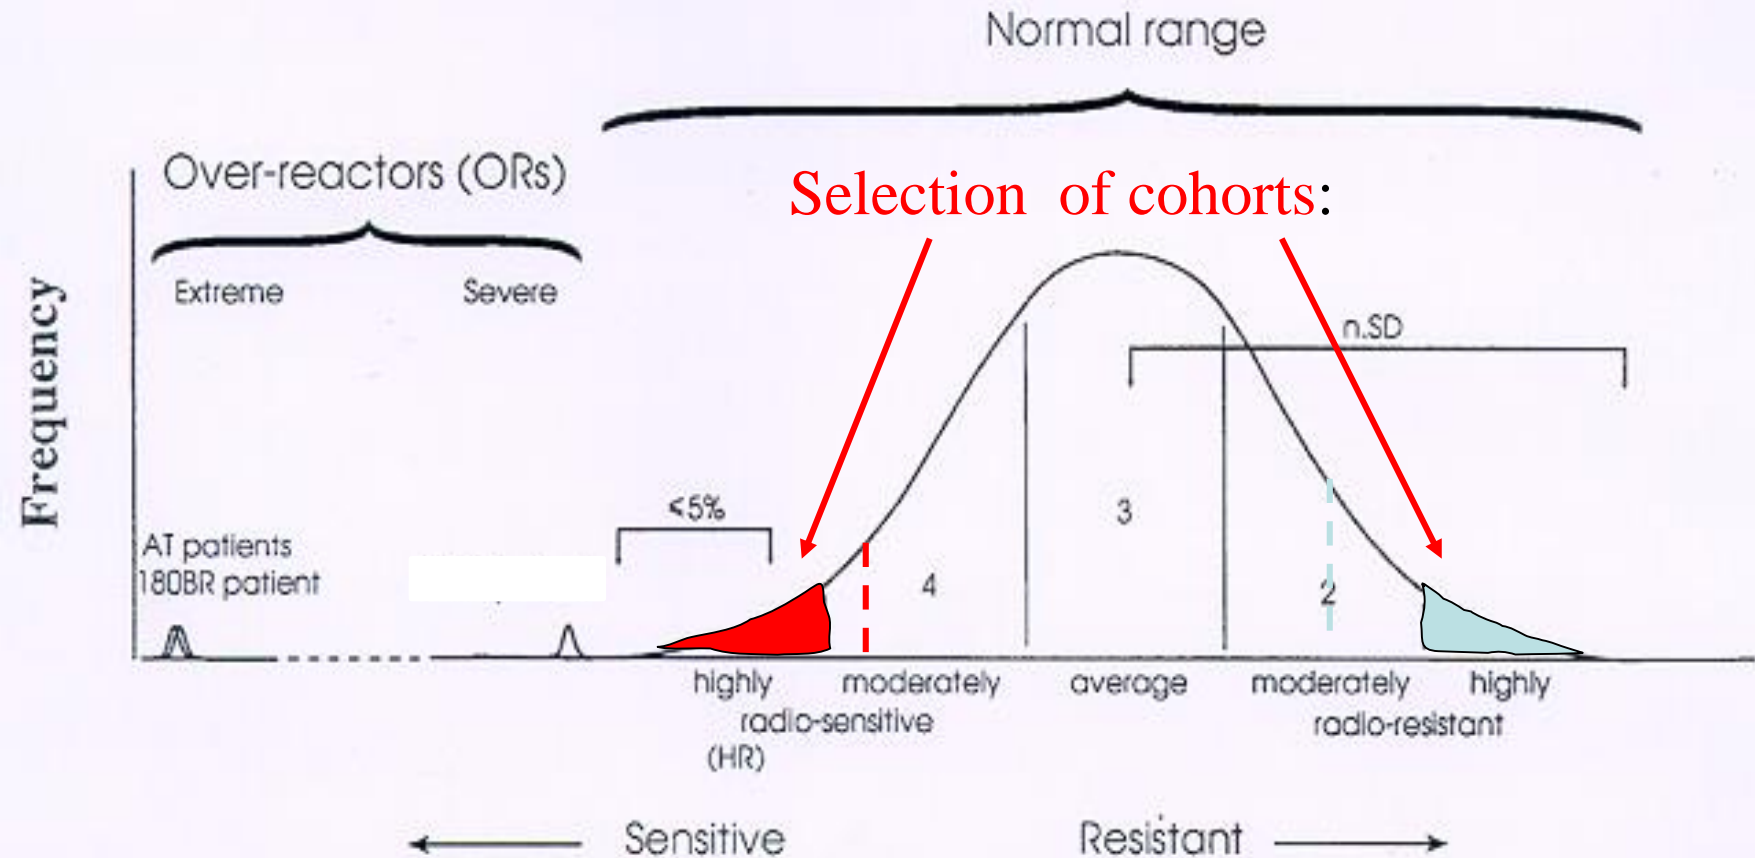

Factors influencing side effects

- Dose per fraction/dose rate
- Total dose
- Target volume and irradiated organ
- Radiation quality
- Life style ...
- Health status
- Individual radiosensitivity: genetic background

Normal distribution of tissue reactions to radiotherapy

DESCRIBING NORMAL TISSUE REACTIONS TO RADIOTHERAPY

609

Idealised normal tissue response - relative scale

Radiation sensitivity

- About 60 percent of all cancer patients receive radiotherapy
- Approximately 20% of RT patients experience **adverse effects** and 3-5% experience **severe adverse effects** are accepted
- The dose is adjusted to the most sensitive individuals

Longterm aim:

To have predictive assay to be able to distinguish between extreme sensitive and normal sensitive patients prior radiotherapy

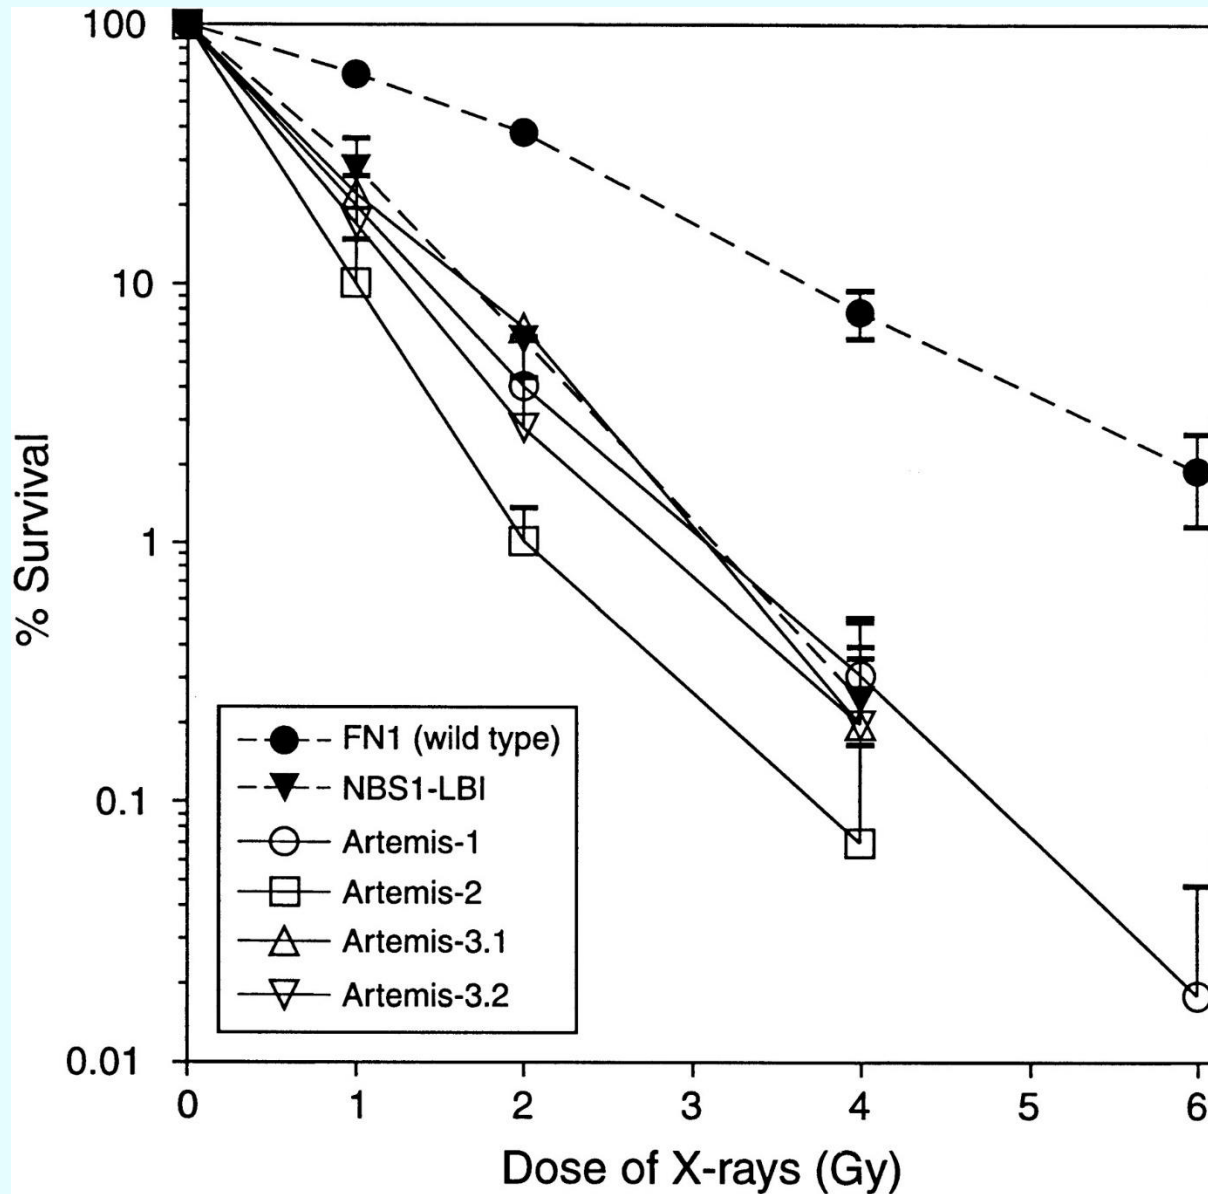

Focus is healthy tissue side effect as dose limiting factor

Number of DNA damage per Gy/cell

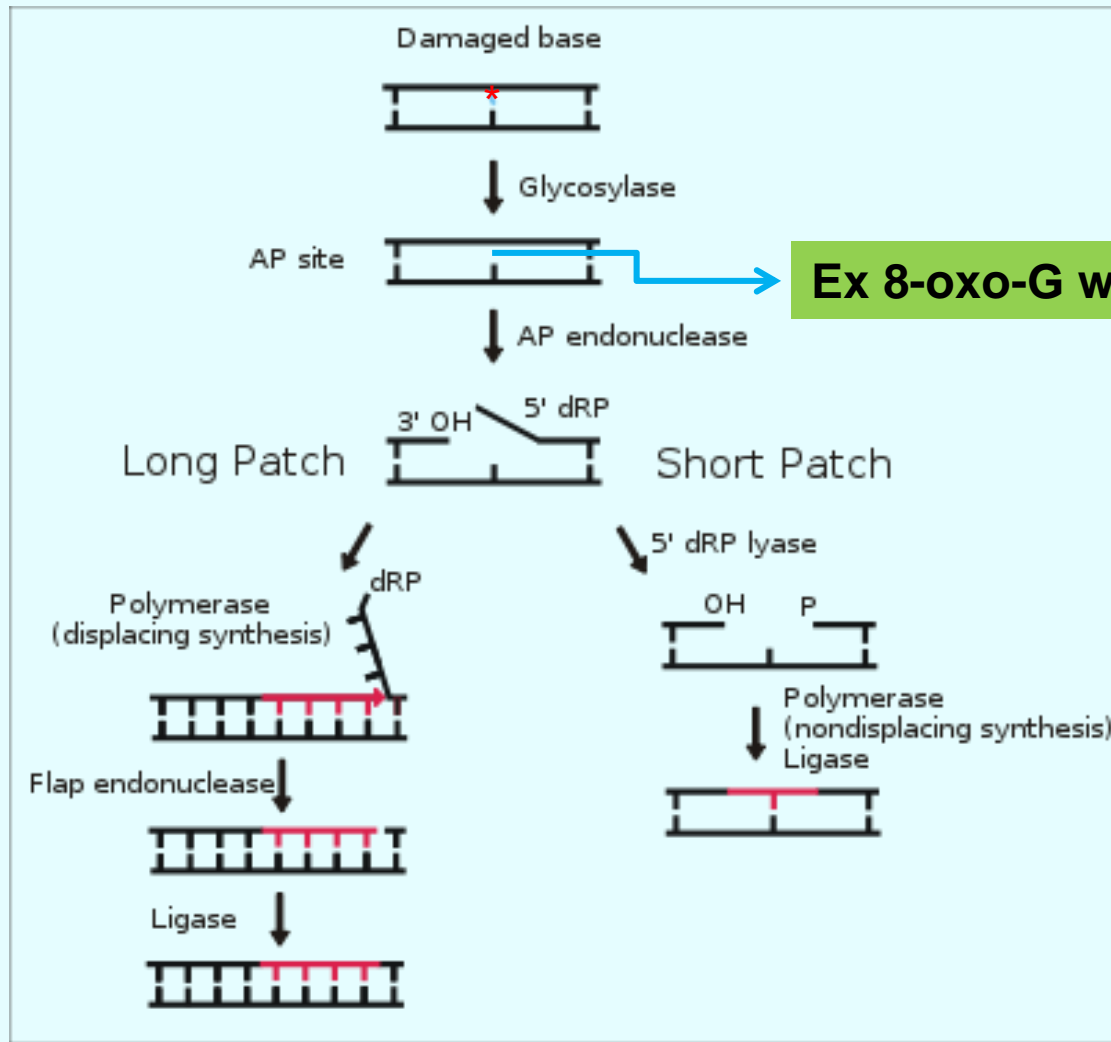

1 Gy photon

- » ~ 20-40 DSB
- » ~1000 SSB
- » ~2000 Base damages

Radiosensitivity of DNA repair deficient cells

Base excision repair pathway

Ex 8-oxo-G with hOGG1

**Out from body via
urine and saliva**

* Damaged base

Hypothesis

Normo-sensensitive patients has better DNA repair, BER, capacity.

If 2 individual with different DNA repair capacities receive same dose:

Lower 8-oxo-dG should be detected in radiosensitive patients after irradiation as compared to normo-sensitive individual

Can urinary 8-oxo-dG be used as a predictor for individual radiosensitivity?

Haghdoust s. et al Intl. J. of Radiation Oncology, Biology, Physics,

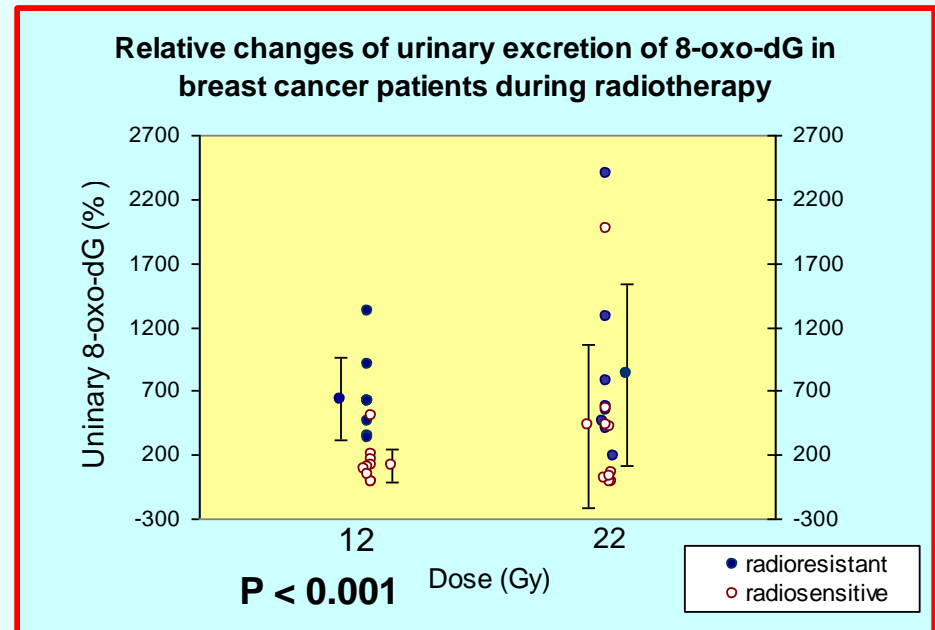

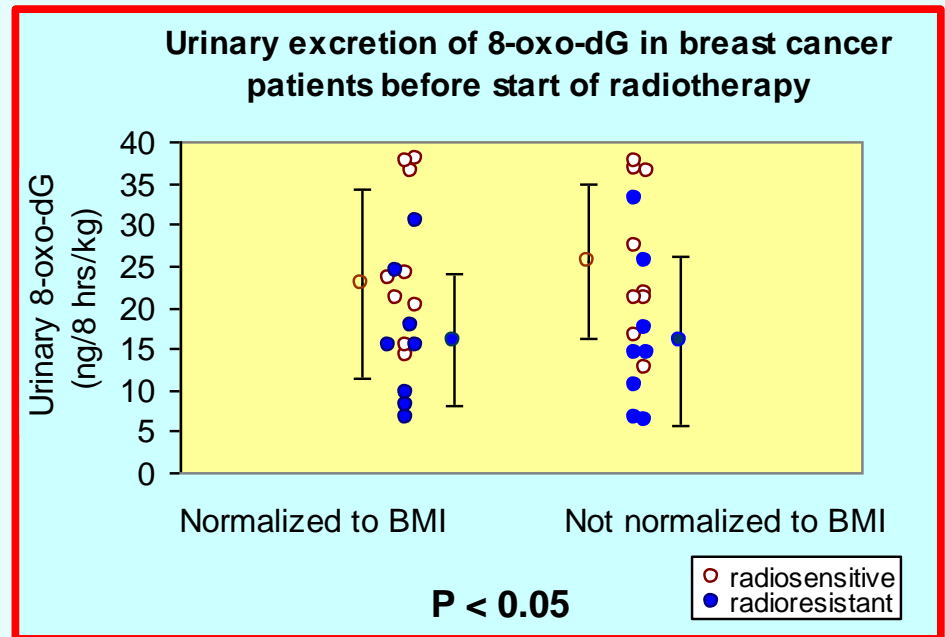

- **Patients**

17 breast cancer patients, radiotherapy after surgery (46 Gy with 2 Gy fractions) to breast and regional lymph nodes

Measured urinary 8-oxo-dG by HPLC-EC before and during radiotherapy

Radiosensitive group:
High background levels and
low therapy related increase
of urinary 8-oxo-dG

Non-sensitive group:
Low background levels and
high therapy related increase
of urinary 8-oxo-dG

Next step: in vitro test

Gamma Irradiation

**1 hour incubation
for repair**

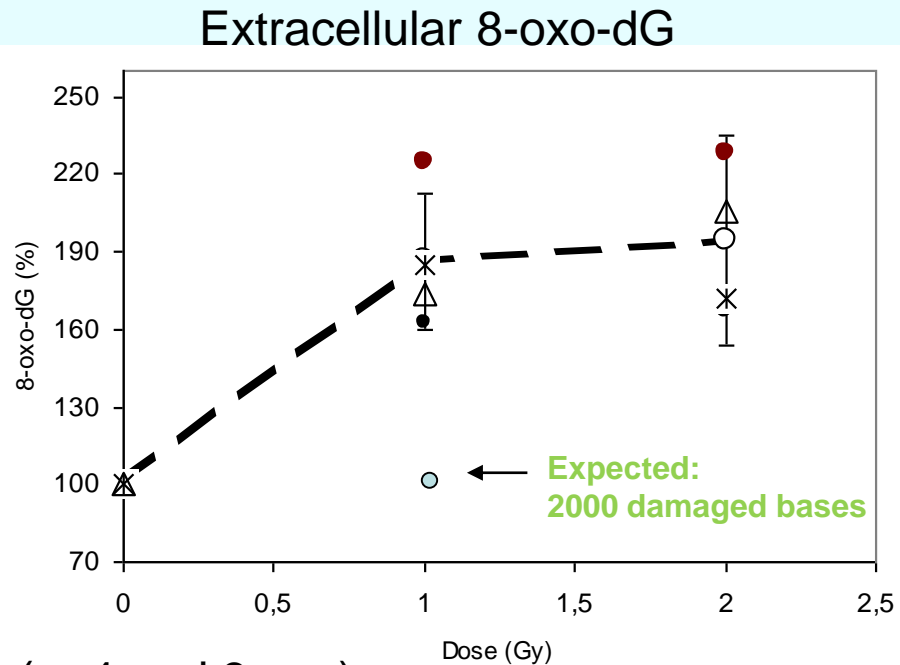

**Detection of oxidized
DNA base in serum**

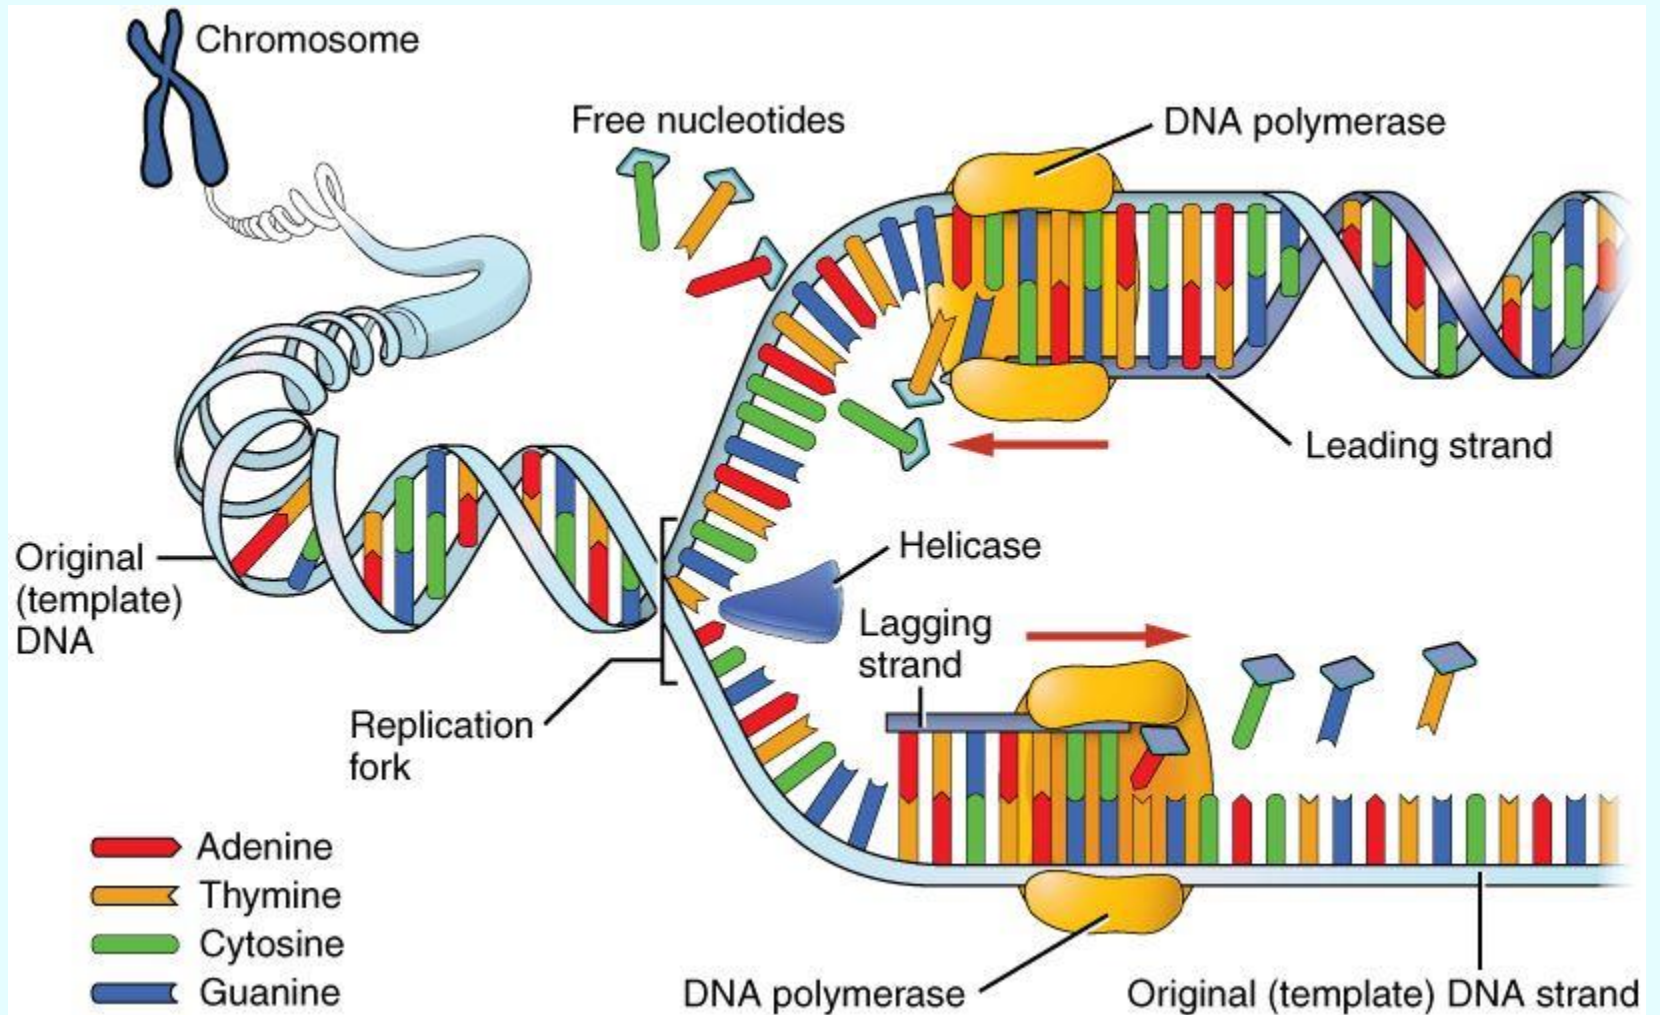

Extracellular 8-oxo-dG as a sensitive marker for oxidative stress in vivo and in vitro

Haghdoust S. et al. Free Radic. Res. 2005

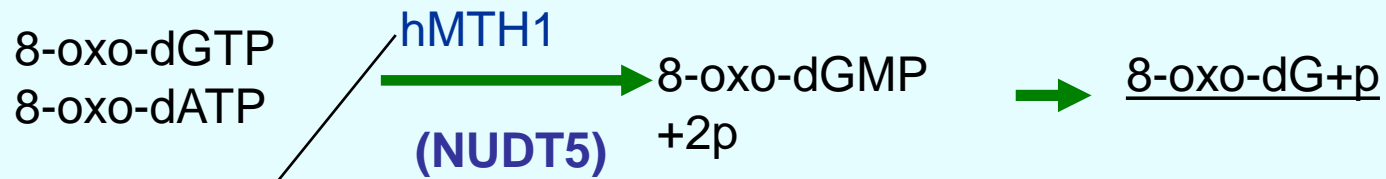

- Amount of 8-oxo-dG excreted by leukocytes, exposed to 1 Gy, is 35 times higher than what is expected to be formed in DNA.
- DNA is not the main source for extracellular 8-oxo-dG

(In vitro study, HPLC)

(dGTP+ ROS \rightarrow 8-oxo-dGTP)
(dATP+ ROS \rightarrow 8-oxo-dATP)

Head and neck cancer cohort

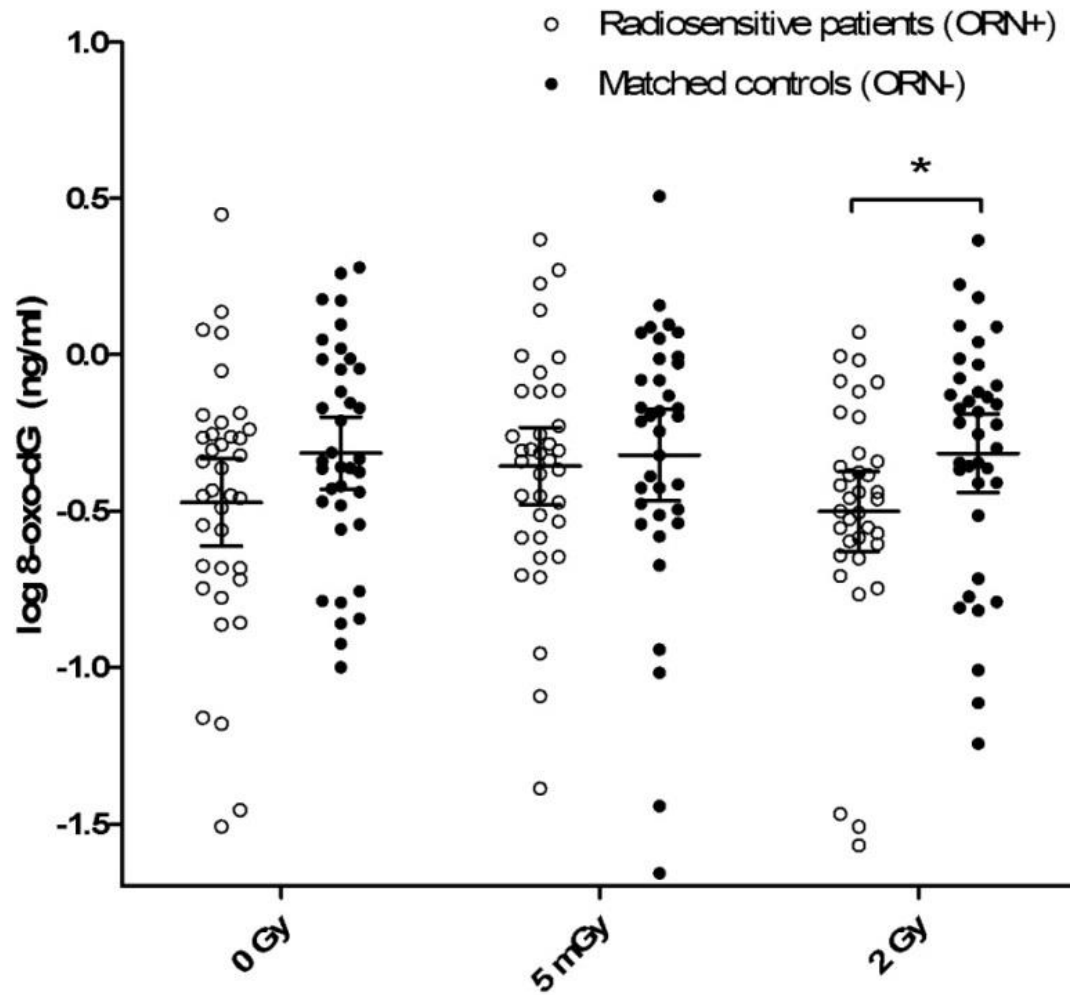

The incidence for ORN is ~5-8%

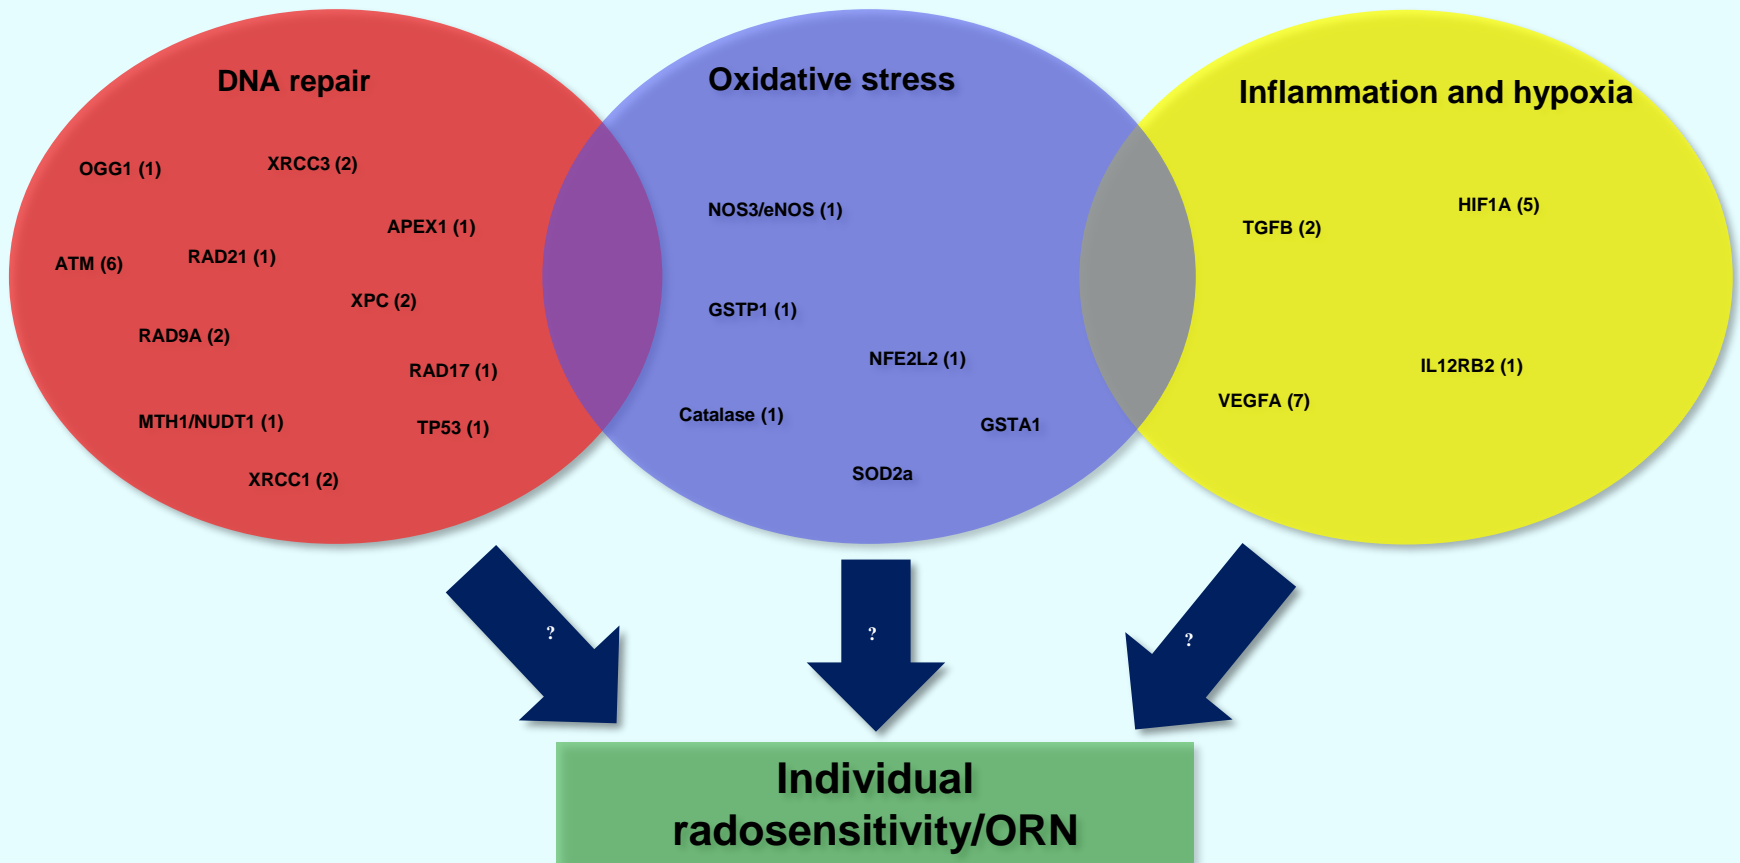

It is a late adverse effect to radiotherapy occurring 1-10 years after the end of the treatment.

Available:

37 patients with osteoradionecrosis (ORN) and 37 matched controls.

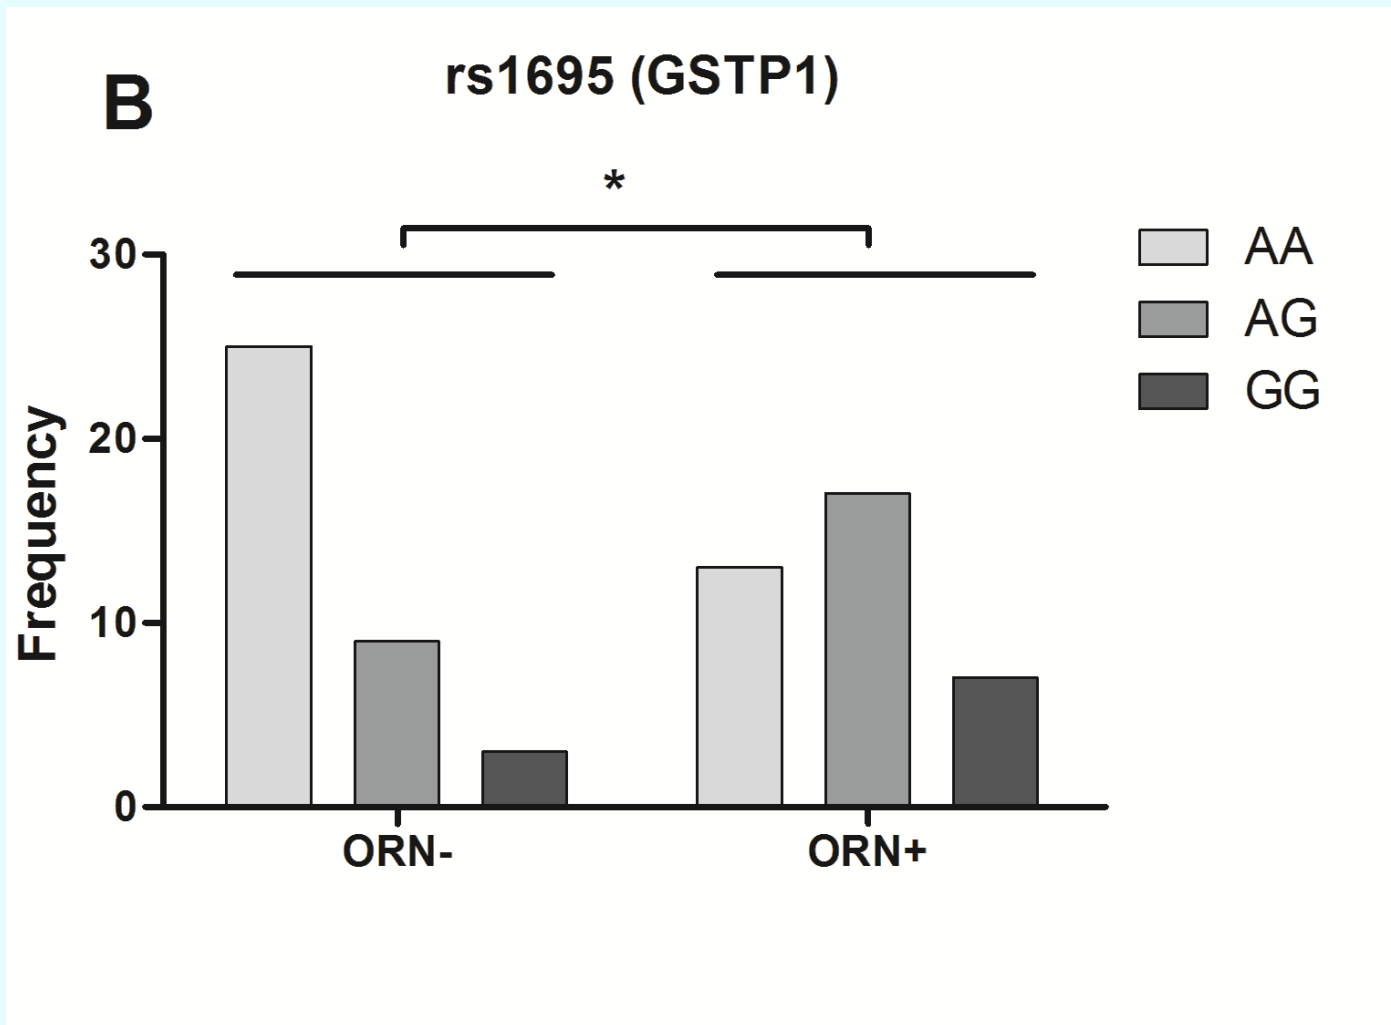

Danielsson, D. et. al. 2014, head and neck

Investigating 58 point mutations (SNPs) previously implicated in side effects to RT

Raw data just now sent from core facility, analysis soon to be initiated

Model for predicting ORN

Predicted logit of (ORN) = $0.14 + (1.21 * \text{brachytherapy}) + (-1.90 * \text{8-oxo-dG 2 Gy}) + (1.31 * \text{rs1695})$.

“brachytherapy” takes value 1 if the patient received/is planned to receive that treatment.

“8-Oxo-dG 2 Gy” is the level of 8-oxo-dG (ng/ml) in the blood serum 60 min after a 2 Gy *in vitro* radiation exposure of whole blood.

Variable “rs1695” takes value 1 if the patient is heterozygous/homozygous for the SNP in GSTP1.

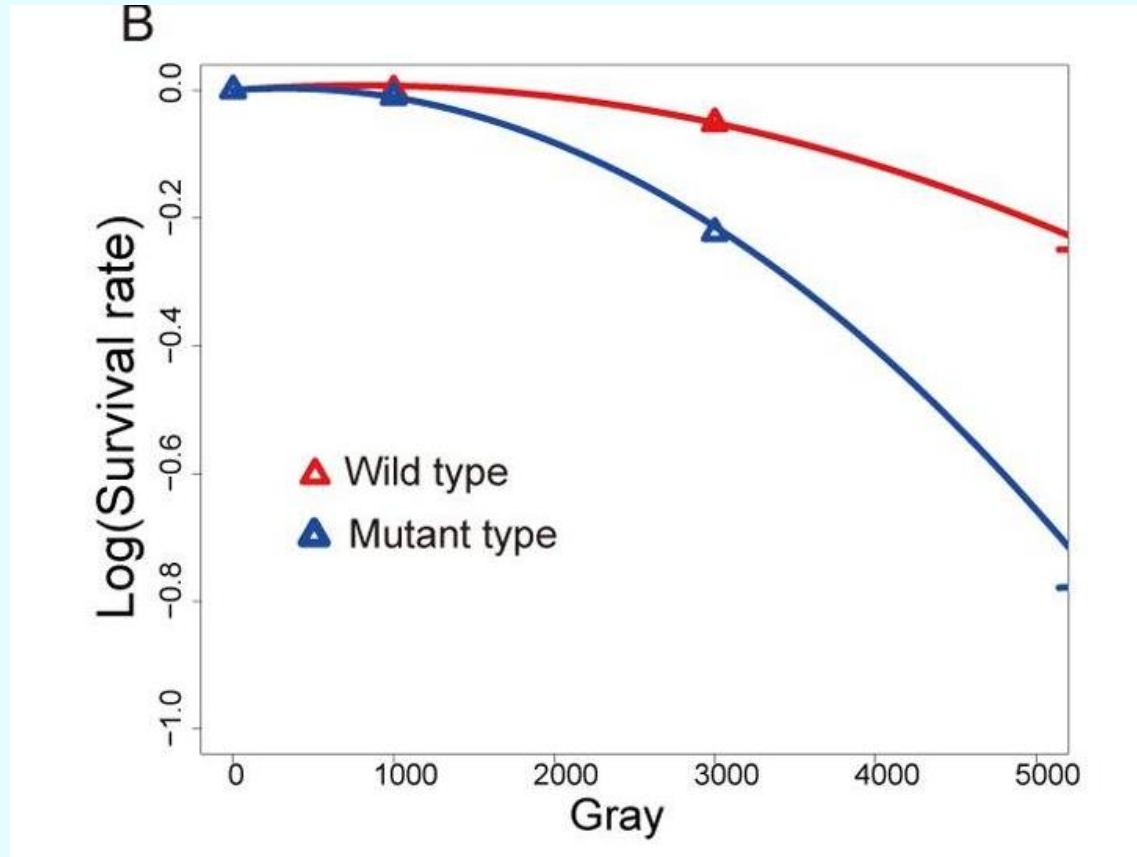

Conclusion

Oxidative stress response is related to clinical radiosensitivity:

- 8-oxo-dG levels
- proteomic approach
- SNP in GSTP1

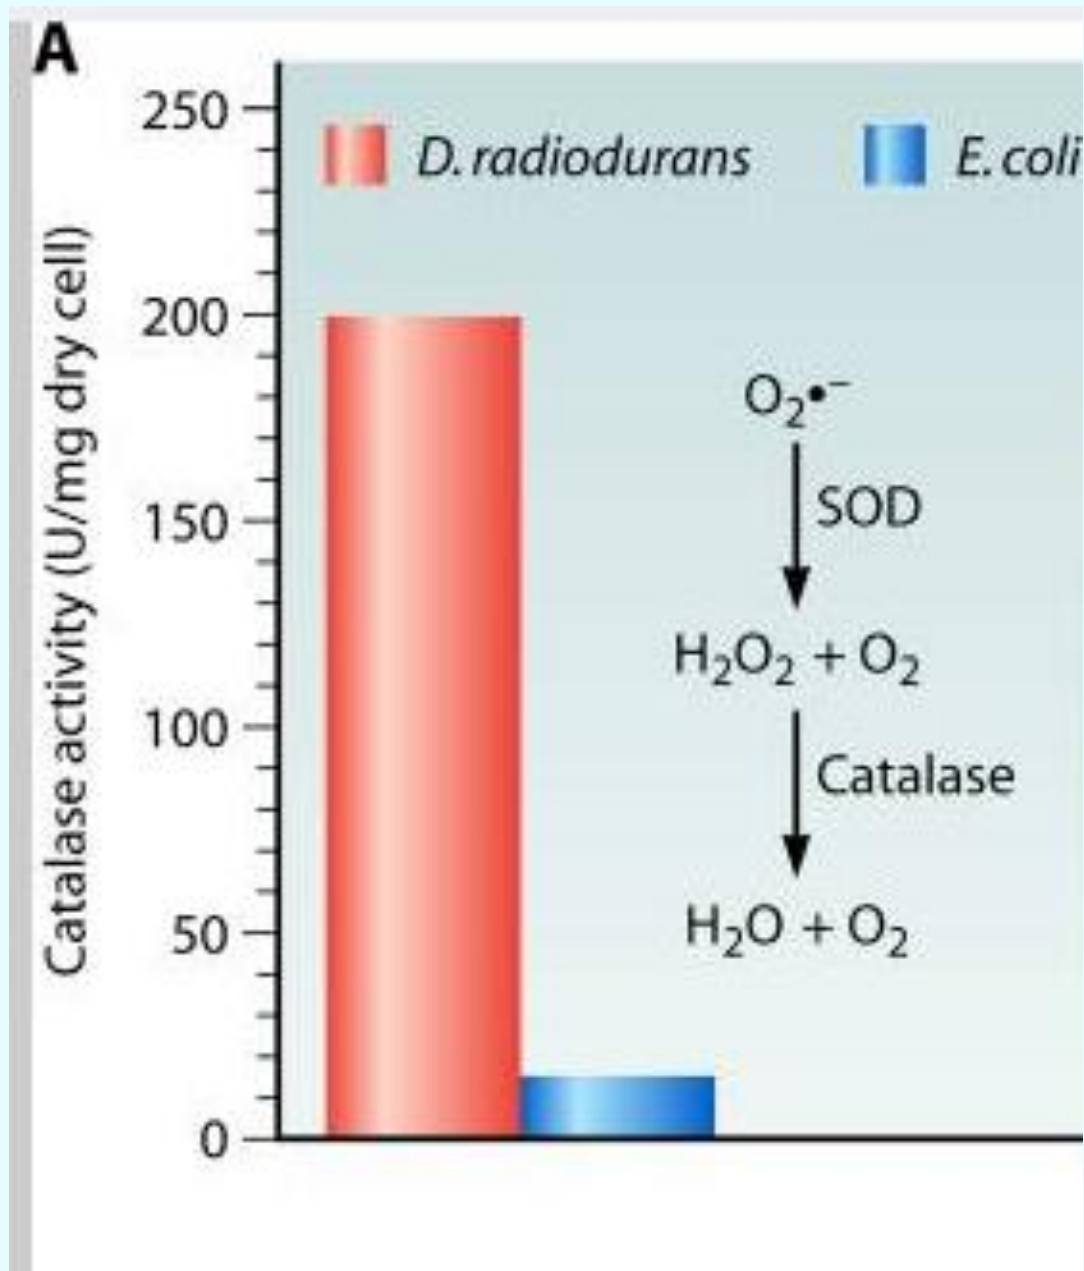

Indication that oxidative stress is an general factor influencing clinical radiosensitivity

Effects of antioxidant in radiosensitivity

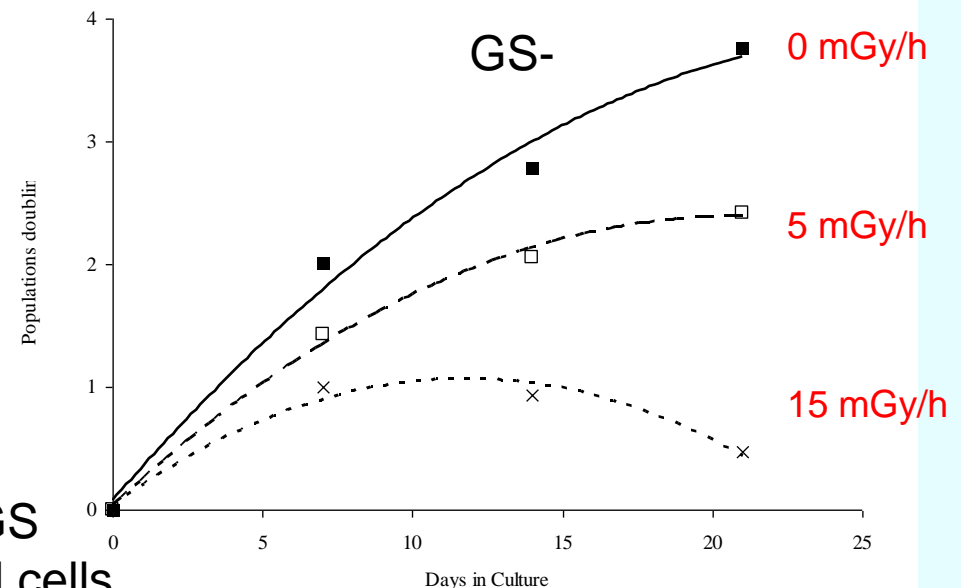

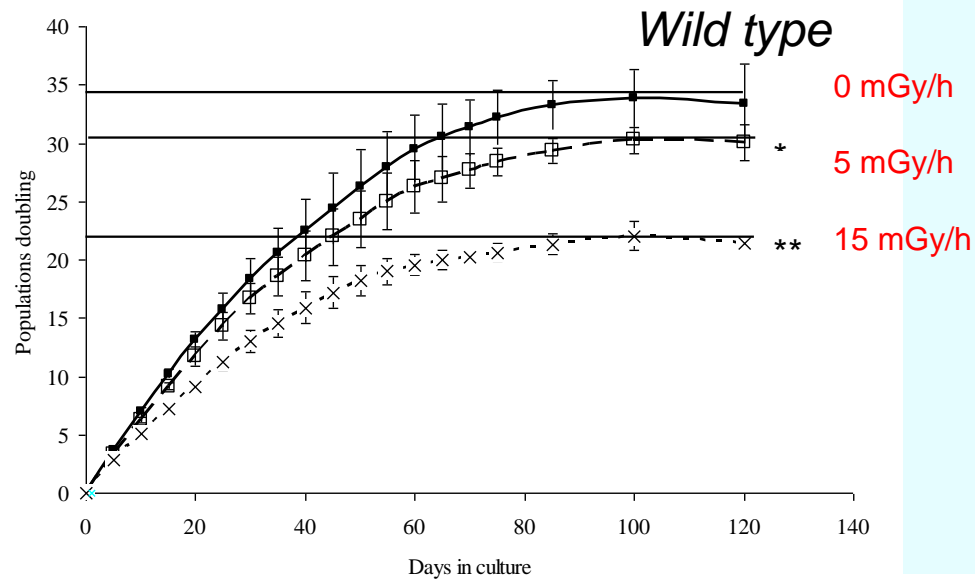

crtB mutant: *crtB* gene is involved in carotenoid biosynthesis

The *crtB* mutant

Health effects of cArdiac fluoRoscopy and MOrderN radlotherapy in paediatrics

Coordinator: IsoGlobal, total budget 7 million Euro

Objectives

The HARMONIC project aims at improving the understanding of the biological and health effects of medical ionising radiation exposure of **paediatric patients**.

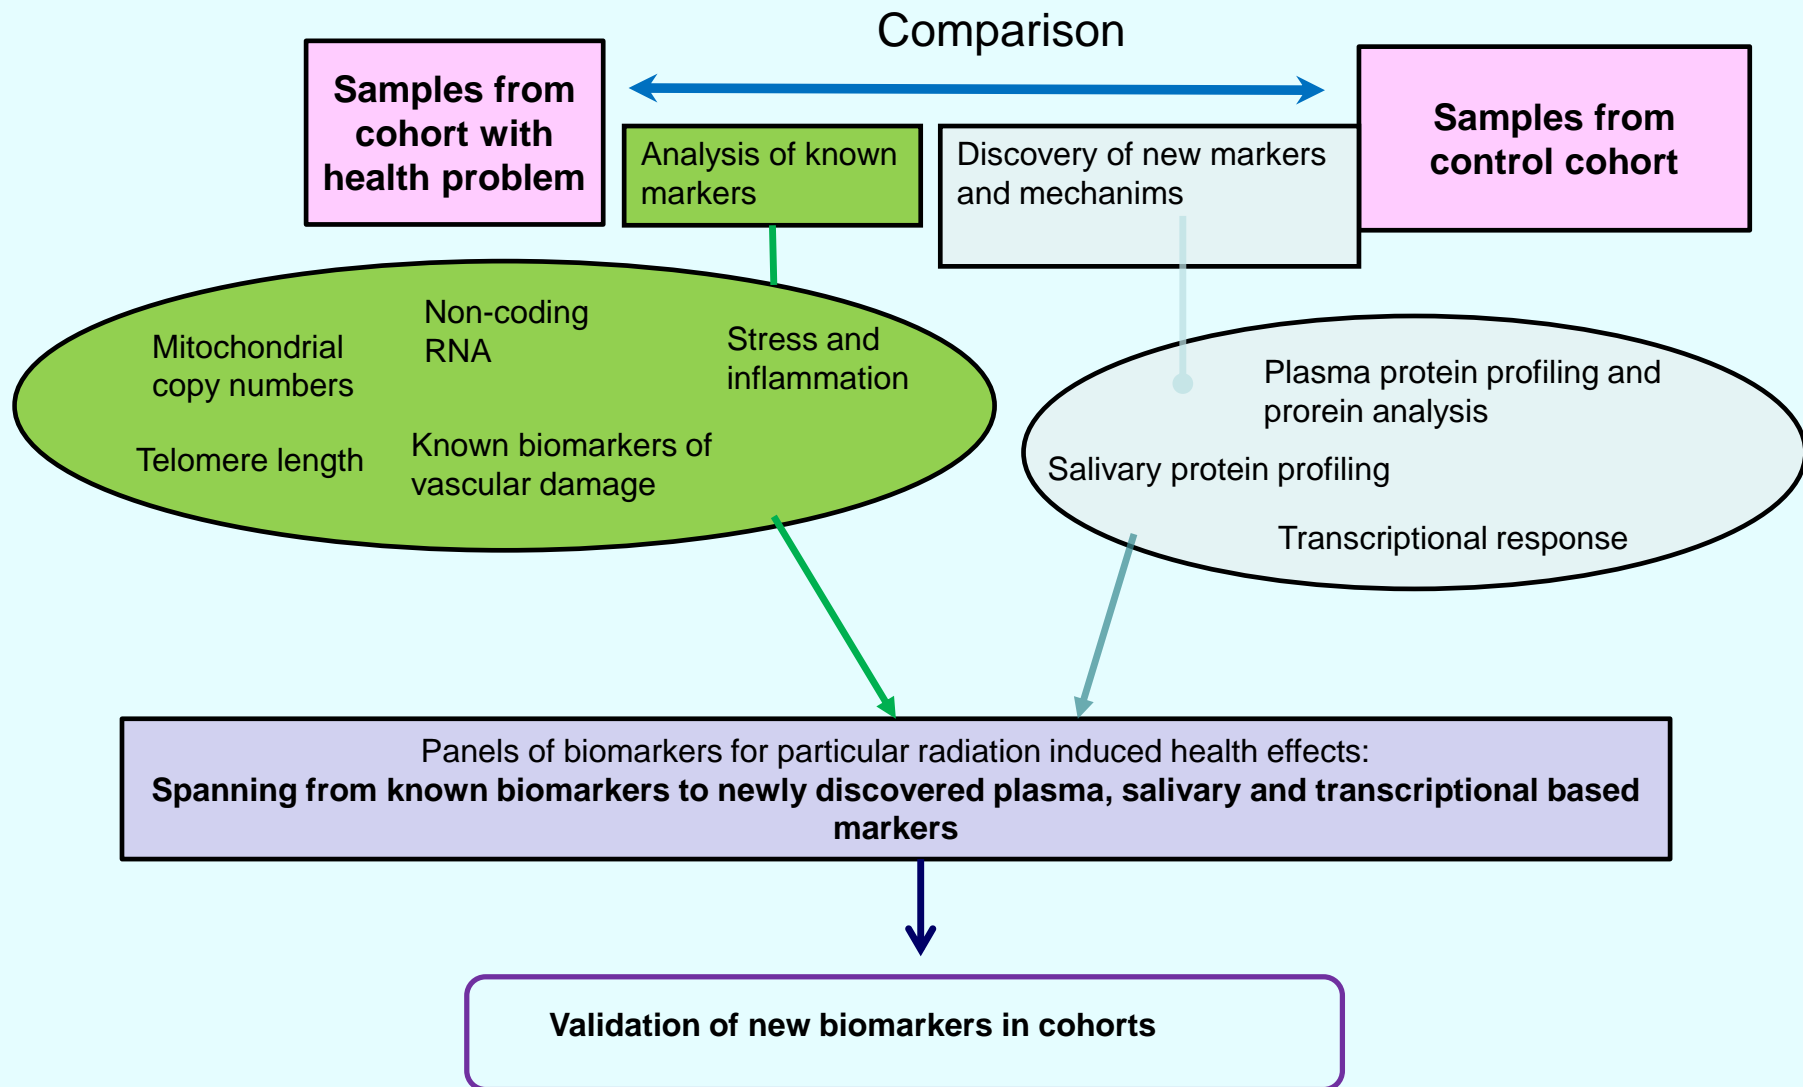

WP5-Biology: Unicaen/CIMAP (France), SU (Sweden), IFC-CNR (Italy) and GR (France)

Objective:

To investigate mechanisms and identify potential biomarkers that can be used

- For individualized therapy or providing rationale for selection of optimal diagnostic/therapeutic methods.
- Focus will be on oncogenic processes and vascular diseases. For molecular epidemiology to refine risk estimates for adverse health effects/disorders

- Thank you for attention
