

Beam Diagnostics Lecture 2

Measuring Complex Accelerator Parameters

Uli Raich

CERN AB-BI

U. Raich, CERN BE/BI African School of Physics 2010

1

Contents of lecture 2

- Some examples of measurements done with the instruments explained during the last lecture
 - Spectroscopy
 - Trajectory and Orbit measurements
 - Tune measurements
 - Traditional method
 - BBQ method
 - Transverse and longitudinal emittance measurements
 - Longitudinal phase space tomography

U. Raich, CERN BE/BI African School of Physics 2010

2

Faraday Cup application Testing the decelerating RFQ

Antiproton decelerator

- Accelerate protons to 24 GeV and eject them onto a target
- Produce antiprotons at 2 GeV
- Collect the antiprotons and cool them
- Decelerate them and cool them
- Output energy: 100 MeV

In order to get even lower energies:

- Pass them through a moderator
 - High losses
 - Large energy distribution

⇒ **Build a decelerating RFQ**

U. Raich, CERN BE/BI African School of Physics
2010

3

Waiting for Godot

Proton beam

2010

4

Setup for charge state measurement

The spectrometer magnet is swept and the current passing the slit is measured

U. Raich, CERN BE/BI African School of Physics 2010

5

Measuring charge state distribution

Faraday Cup

Slit

Spectrometer magnets

U. Raich, CERN BE/BI African School of Physics 2010

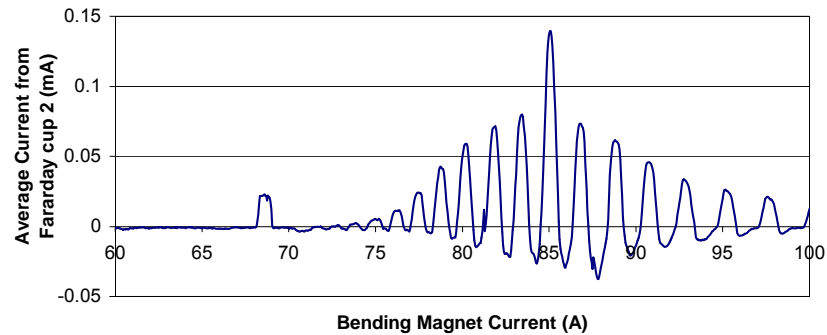

6

Charge state distribution measured with a Faraday Cup on a heavy ion source

Scan of Bending magnet Current with extraction voltage 20.5kV -
11/04/03 -JCh

U. Raich, CERN BE/BI African School of Physics
2010

7

Trajectory and Orbit measurements

Definitions:

Trajectory: The mean positions of the beam during 1 turn

Orbit: The mean positions over many turns for each of the BPMs

The trajectories must be controlled at injection, ejection, transition
Closed orbits may change during acceleration or RF “gymnastics”

U. Raich, CERN BE/BI African School of Physics
2010

8

LHC Button BPMs

U. Raich, CERN BE/BI African School of Physics
2010

9

Trajectory Measurement at LHC injection

Knowing the optics one can deduce the orbit correction from the measurement

U. Raich, CERN BE/BI African School of Physics
2010

10

The PUs

U. Raich, CERN BE/BI African School of Physics
2010

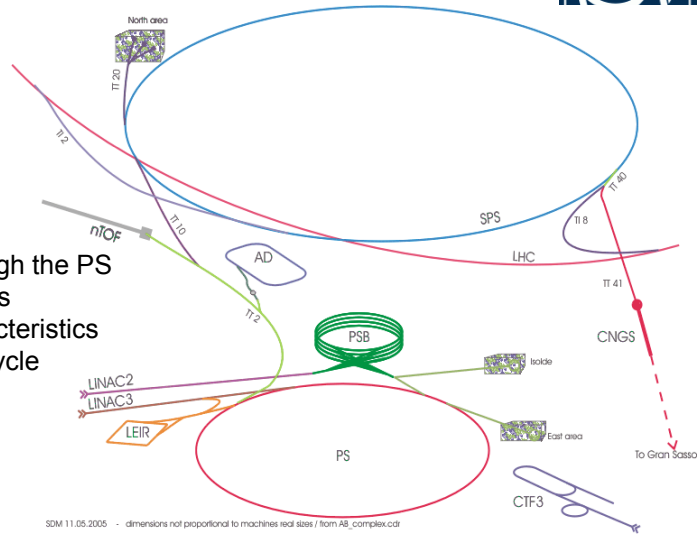

11

The PS, a universal machine

All beams pass through the PS
Different particle types
Different beam characteristics
Concept of a super cycle

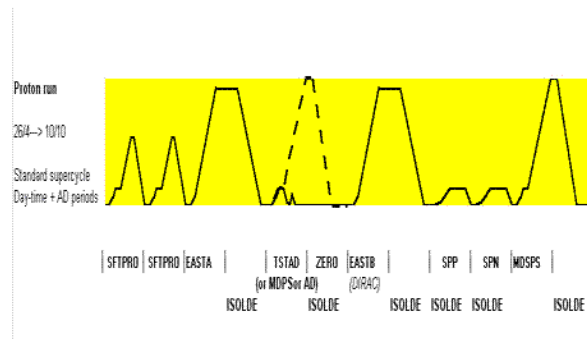

SOM 11.05.2005 - dimensions not proportional to machines real sizes / from AB_complex.cdr

U. Raich, CERN BE/BI African School of Physics
2010

12

The super cycle

U. Raich, CERN BE/BI African School of Physics
2010

13

Position Measurements

Red: The sum signal
Green: The difference signal

Procedure:
Produce integration gates and
Baseline signals
Baseline correct both signals
Integrate sum and difference signals
and store results in memory
Take external timing events into
account e.g. harmonic number
change, γ -transition etc.

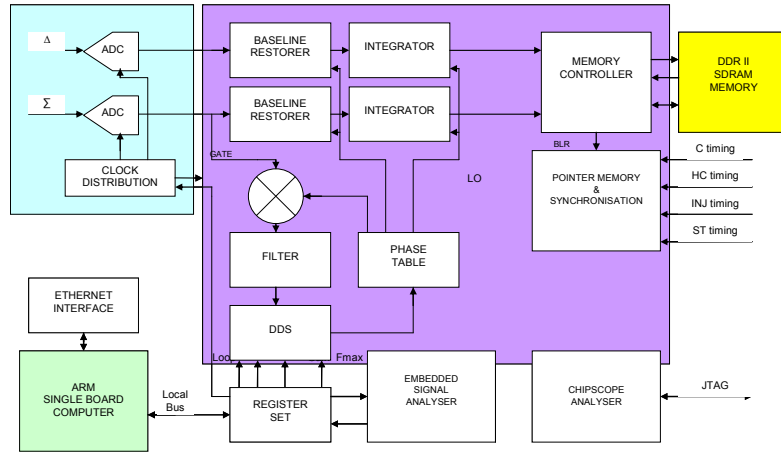

U. Raich, CERN BE/BI African School of Physics
2010

14

Trajectory readout electronics

U. Raich, CERN BE/BI African School of Physics
2010

Baseline restoration

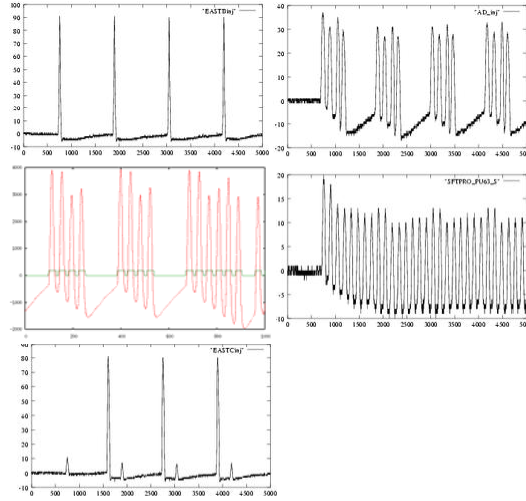

Low pass filter the signal to get an estimate of the base line
Add this to the original signal

U. Raich, CERN BE/BI African School of Physics
2010

Beams in the PS

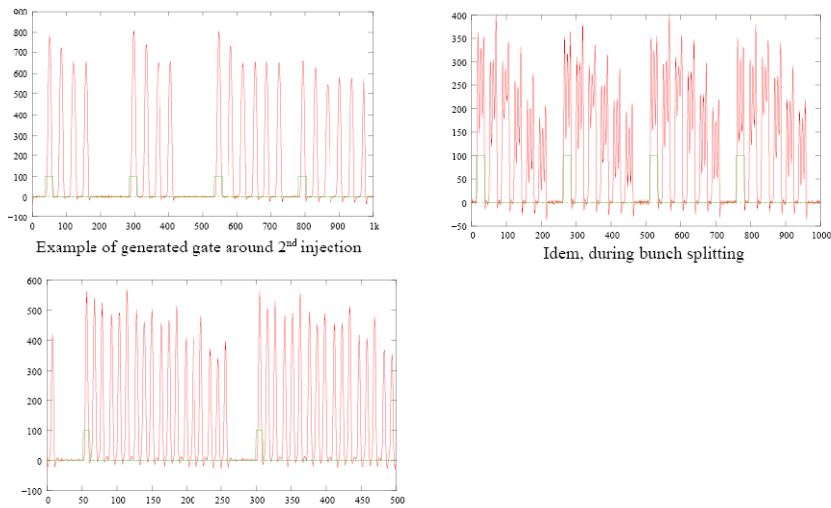

U. Raich, CERN BE/BI African School of Physics 2010

17

RF Gymnastics

U. Raich, CERN BE/BI African School of Physics 2010

18

Trajectory measurements in circular machines

Needs integration gate
Can be rather tricky
Distance between bunches
changes with acceleration
Number of bunches
may change

Raw data from pick-ups
double batch injection

U. Raich, CERN BE/BI African School of Physics
2010

19

Changing bunch frequency

- Bunch splitting or recombination
- One RF frequency is gradually decrease while the other one is increased
- Batch compression

For all these cases the gate
generator must be synchronized

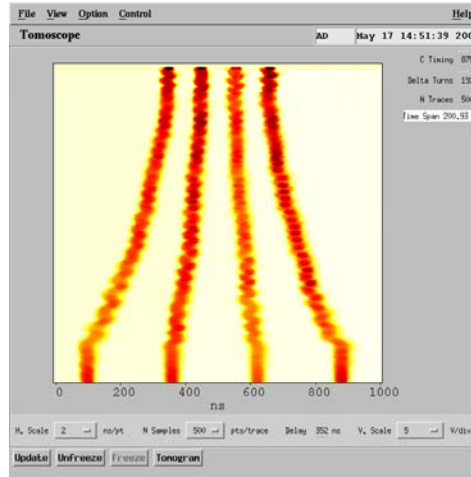

U. Raich, CERN BE/BI African School of Physics
2010

20

Batch compression

U. Raich, CERN BE/BI African School of Physics
2010

21

Tune measurements

- When the beam is displaced (e.g. at injection or with a deliberate kick), it starts to oscillate around its nominal orbit (betatron oscillations)
- Measure the trajectory
- Fit a sine curve to it
- Follow it during one revolution

U. Raich, CERN BE/BI African School of Physics
2010

22

The Sensors

The kicker

Shoebox pick-up with linear cut

U. Raich, CERN BE/BI African School of Physics 2010

23

Tune measurements with a single PU

Design by P. Forck

U. Raich, CERN BE/BI African School of Physics 2010

24

Kicker + 1 pick-up

- Measures only non-integral part of Q
- Measure a beam position at each revolution

Fourier transform of pick-up signal

U. Raich, CERN BE/BI African School of Physics
2010

25

Periodic extension of the signal and Windowing

U. Raich, CERN BE/BI African School of Physics
2010

26

Windowing

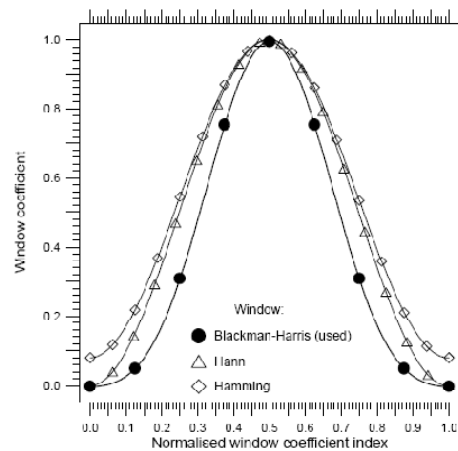

The Discrete Fourier Transform assumes one cycle of a repetitive signal.

Blackman-Harris Window is used

Each sample is multiplied with a coefficient

Coefficients are pre-calculated and stored in a table

U. Raich, CERN BE/BI African School of Physics
2010

27

Peak search algorithm

- Power value is bigger than its predecessor
- Power value is bigger than its successor
- Power value is biggest in the whole spectrum
- The power value is at least 3 times bigger than the arithmetic mean of all power bins.

U. Raich, CERN BE/BI African School of Physics
2010

28

Q interpolation

Betatron signal is not a pure Harmonic but includes rev. freq Harmonics, noise ...
 The windowing process is not Perfect
 Coherent betatron signal is Damped in the time domain

$$V(n_{\beta}-1) = a(n_{\beta}-1)^2 + b(n_{\beta}-1) + c$$

$$V(n_{\beta}) = an_{\beta}^2 + bn_{\beta} + c$$

$$V(n_{\beta}+1) = a(n_{\beta}+1)^2 + b(n_{\beta}+1) + c$$

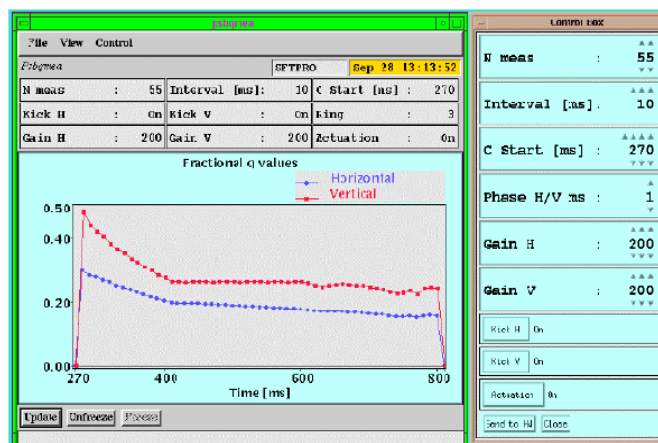

U. Raich, CERN BE/BI African School of Physics
 2010

29

Q-Measurement Results

U. Raich, CERN BE/BI African School of Physics
 2010

30

Direct Diode Detection Base Band Q measurement

- Diode Detectors convert spikes to saw-tooth waveform
- Signal is connected to differential amplifier to cut out DC level
- Filter eliminates most of the revolution frequency content
- Output amplifier brings the signal level to amplitudes suitable for long distance transmission

U. Raich, CERN BE/BI African School of Physics
2010

31

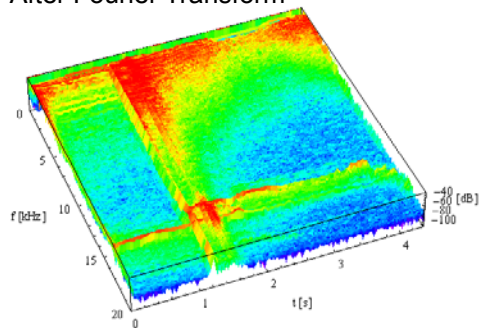

BBQ Results from CERN SPS

Results from Sampling

After Fourier Transform

2010

32

Tune feedback at the LHC

U. Raich, CERN BE/BI African School of Physics 2010 33

Emittance measurements

A beam is made of many many particles, each one of these particles is moving with a given velocity. Most of the velocity vector of a single particle is parallel to the direction of the beam as a whole (s). There is however a smaller component of the particles velocity which is perpendicular to it (x or y).

$$\vec{v}_{particle} = v_s \hat{u}_s + v_x \hat{u}_x + v_y \hat{u}_y$$

Design by E. Bravin

U. Raich, CERN BE/BI African School of Physics 2010

34

Emittance measurements

- If for each beam particle we plot its position and its transverse angle we get a particle distribution whose boundary is an usually ellipse.
- The projection onto the x axis is the beam size

U. Raich, CERN BE/BI African School of Physics
2010

35

The slit method

- If we place a slit into the beam we cut out a small vertical slice of phase space
- Converting the angles into position through a drift space allows to reconstruct the angular distribution at the position defined by the slit

slit

U. Raich, CERN BE/BI African School of Physics
2010

36

Transforming angular distribution to profile

- When moving through a **drift space** the angles don't change (**horizontal move** in phase space)
- When moving through a **quadrupole** the position does not change but the angle does (**vertical move** in phase space)

U. Raich, CERN BE/BI African School of Physics
2010

37

The Slit Method

3-dim plot:

U. Raich, CERN BE/BI African School of Physics
2010

38

Phase Space Scanner

U. Raich, CERN BE/BI African School of Physics
2010

39

Moving slit emittance measurement

- Position resolution given by slit size and displacement
- Angle resolution depends on resolution of profile measurement device and drift distance
- High position resolution → many slit positions → slow
- Shot to shot differences result in measurement errors

U. Raich, CERN BE/BI African School of Physics
2010

40

Single pulse emittance measurement

U. Raich, CERN BE/BI African School of Physics 2010

41

Transformation in Phase Space

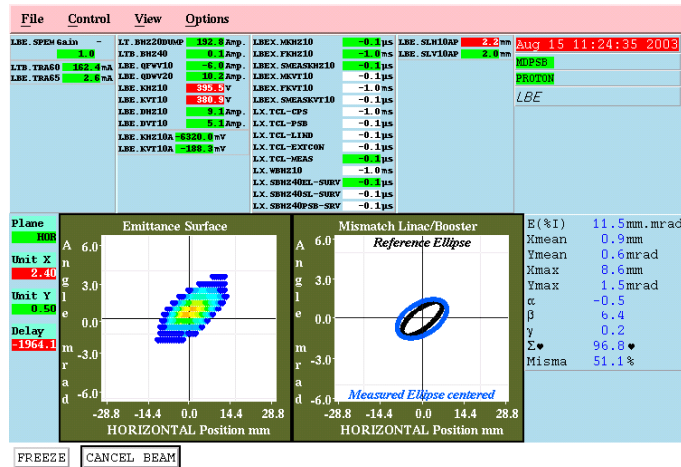

U. Raich, CERN BE/BI African School of Physics 2010

42

Result of single pulse emittance measurement

Waiting for new acquisition...

U. Raich, CERN BE/BI African School of Physics
2010

43

Single Shot Emittance Measurement

- Advantage:
 - Full scan takes 20 μ s
 - Shot by shot comparison possible
- Disadvantage:
 - Very costly
 - Needs dedicated measurement line
 - Needs a fast sampling ADC + memory for each wire
- Cheaper alternative:
 - Multi-slit measurement

U. Raich, CERN BE/BI African School of Physics
2010

44

Multi-slit measurement

- Needs high resolution profile detector
- Must make sure that profiles don't overlap

Scintillator + TV + frame grabber often used as profile detector

Very old idea, was used with photographic plates

U. Raich, CERN BE/BI African School of Physics
2010

45

Pepperpot

Uses small holes instead of slits

Measures horizontal and vertical emittance in a single shot

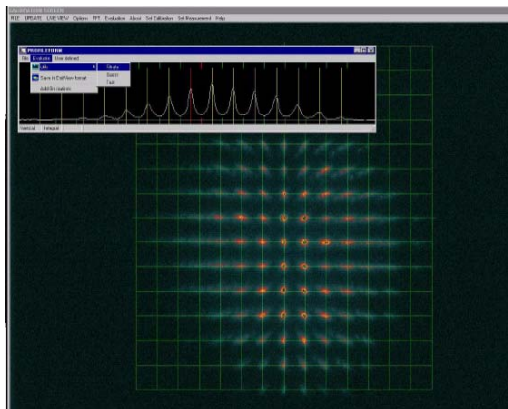

Photo P. Forck

U. Raich, CERN BE/BI African School of Physics
2010

46

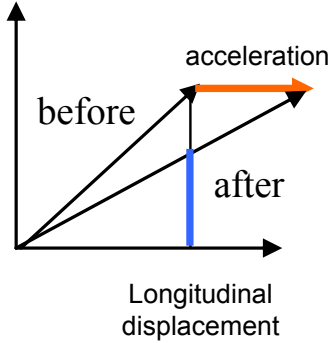

Adiabatic damping

Change of emittance with acceleration

Transverse displacement

$$\epsilon_{norm} = \epsilon_{physical} \beta \gamma$$

β : speed
 γ : Lorentz factor

$$\gamma = \frac{1}{\sqrt{1 - \beta^2}}$$

U. Raich, CERN BE/BI African School of Physics
 2010

47

Longitudinal Phase Space Transformation

- Spectrometer produces image of slit on second slit
- second slit selects energy slice
- first kicker sweep phase space over all energies
- buncher rotates energy slice in phase space
- at second spectrometer the phase distribution is transformed into an energy distribution analyzed by the second spectrometer
- second kicker corrects for first kick

U. Raich, CERN BE/BI African School of Physics
 2010

48

Transverse Emittance measurement

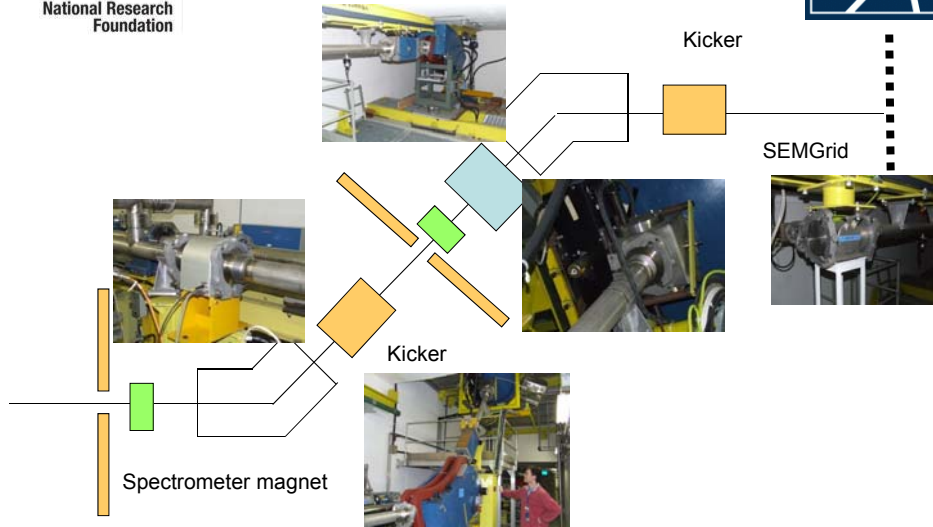

U. Raich, CERN BE/BI African School of Physics 2010

49

Photos of the line

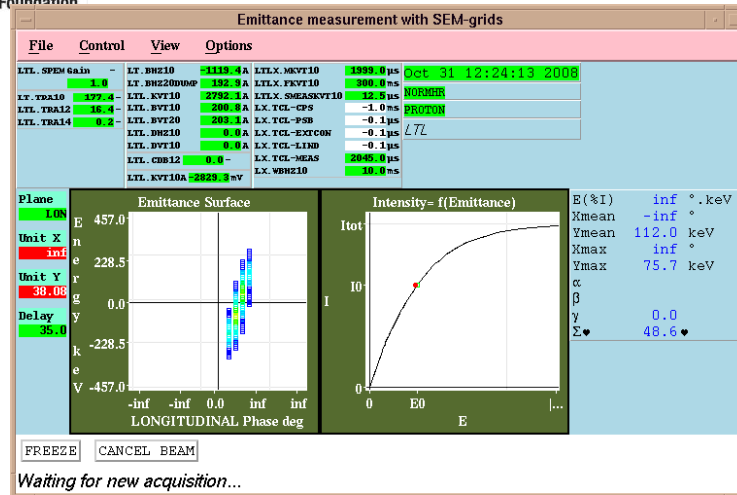

U. Raich, CERN BE/BI African School of Physics 2010

50

Application Program

U. Raich, CERN BE/BI African School of Physics
2010

51

Computed Tomography (CT)

Principle of Tomography:

- Take many 2-dimensional Images at different angles
- Reconstruct a 3-dimensional picture using mathematical techniques (Algebraic Reconstruction Technique, ART)

U. Raich, CERN BE/BI African School of Physics
2010

52

The reconstruction

Produce many projections of the object to be reconstructed

Back project and overlay the "projection rays"

Project the back-projected object and calculate the difference

Iteratively back-project the differences to reconstruct the original object

Some CT results

Computed Tomography and Accelerators

RF voltage

Restoring force for non-synchronous particle

Longitudinal phase space

Projection onto Φ axis corresponds to bunch profile

U. Raich, CERN BE/BI African School of Physics
2010

55

Reconstructed Longitudinal Phase Space

U. Raich, CERN BE/BI African School of Physics
2010

56

Bunch Splitting
