Making FAIR Easy

Wednesday, 19 June 2019 16:00 (20 minutes)

In the recent years we have seen a rapid uptake of the FAIR principles. Many organisations and individuals got interested in the potential of the principles to improve the data landscape. After the initial widespread acknowledgment on the relevance of using the principles as guidelines towards a more integrated data environment, the natural next step is to make them concrete in terms of best practices and technological solutions. In this talk we aim at, starting by understanding the intentions of the FAIR principles, discuss what an ecosystem of software solutions and best practices to facilitate the adoption of the principles looks like.
