

Physics at FCC: a perspective

Michelangelo L. Mangano
TH Department
CERN, Geneva

Why the FCC?

because!

the skeptical

- **the technology skeptical** (“*too ambitious, too \$\$*”)
- **the timescale skeptical** (“*call me when you’re ready*”)
- **the discovery skeptical** (“*no guarantee*”)
- **the precision skeptical** (“*how boring, who cares*”)
- ...

The challenge of sharing a vision

The next steps in HEP build on

- **having important questions to pursue**
- **creating opportunities to answer them**
- **being able to constantly add to our knowledge,
while seeking those answers**

The important questions

- **Data driven:**

- DM
- Neutrino masses
- Matter vs antimatter asymmetry
- Dark energy
- ...

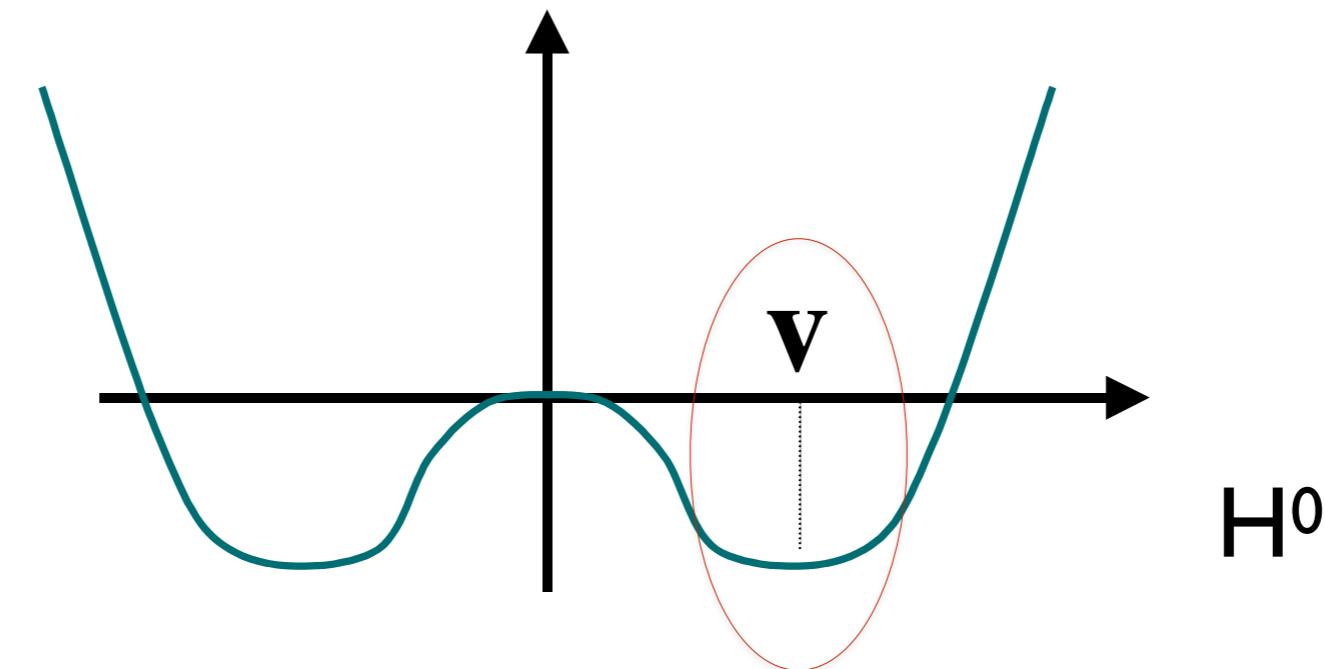

- **Theory driven:**

- The hierarchy problem and naturalness
- The flavour problem (origin of fermion families, mass/mixing pattern)
- Quantum gravity
- Origin of inflation
- ...

The opportunities

- For none of these questions, the path to an answer is unambiguously defined.
- Two examples:
 - DM: could be anything from fuzzy 10^{-22} eV scalars, to $\text{O}(\text{TeV})$ WIMPs, to multi- M_\odot primordial BHs, passing through axions and sub-GeV DM
 - *a vast array of expts* is needed, even though most of them will end up empty-handed...
- Neutrino masses: could originate anywhere between the EW and the GUT scale
 - we are still in the process of acquiring basic knowledge about the neutrino sector: mass hierarchy, majorana nature, sterile neutrinos, CP violation, correlation with mixing in the charged-lepton sector ($\mu \rightarrow e\gamma$, $H \rightarrow \mu\tau$, ...): as for DM, *a broad range of options*
- We cannot objectively establish a hierarchy of relevance among the fundamental questions. The hierarchy evolves with time (think of GUTs and proton decay searches!) and is likely subjective. It is also likely that several of the big questions are tied together and will find their answer in a common context (eg DM and hierarchy problem, flavour and nu masses, quantum gravity/inflation/dark energy, ...)

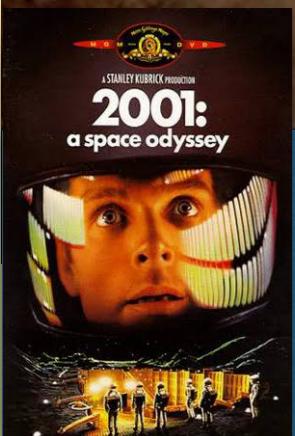

One question, however, has emerged in stronger and stronger terms from the LHC, and appears to single out a unique well defined direction....

$$V(H) = -\mu^2 |H|^2 + \lambda |H|^4$$

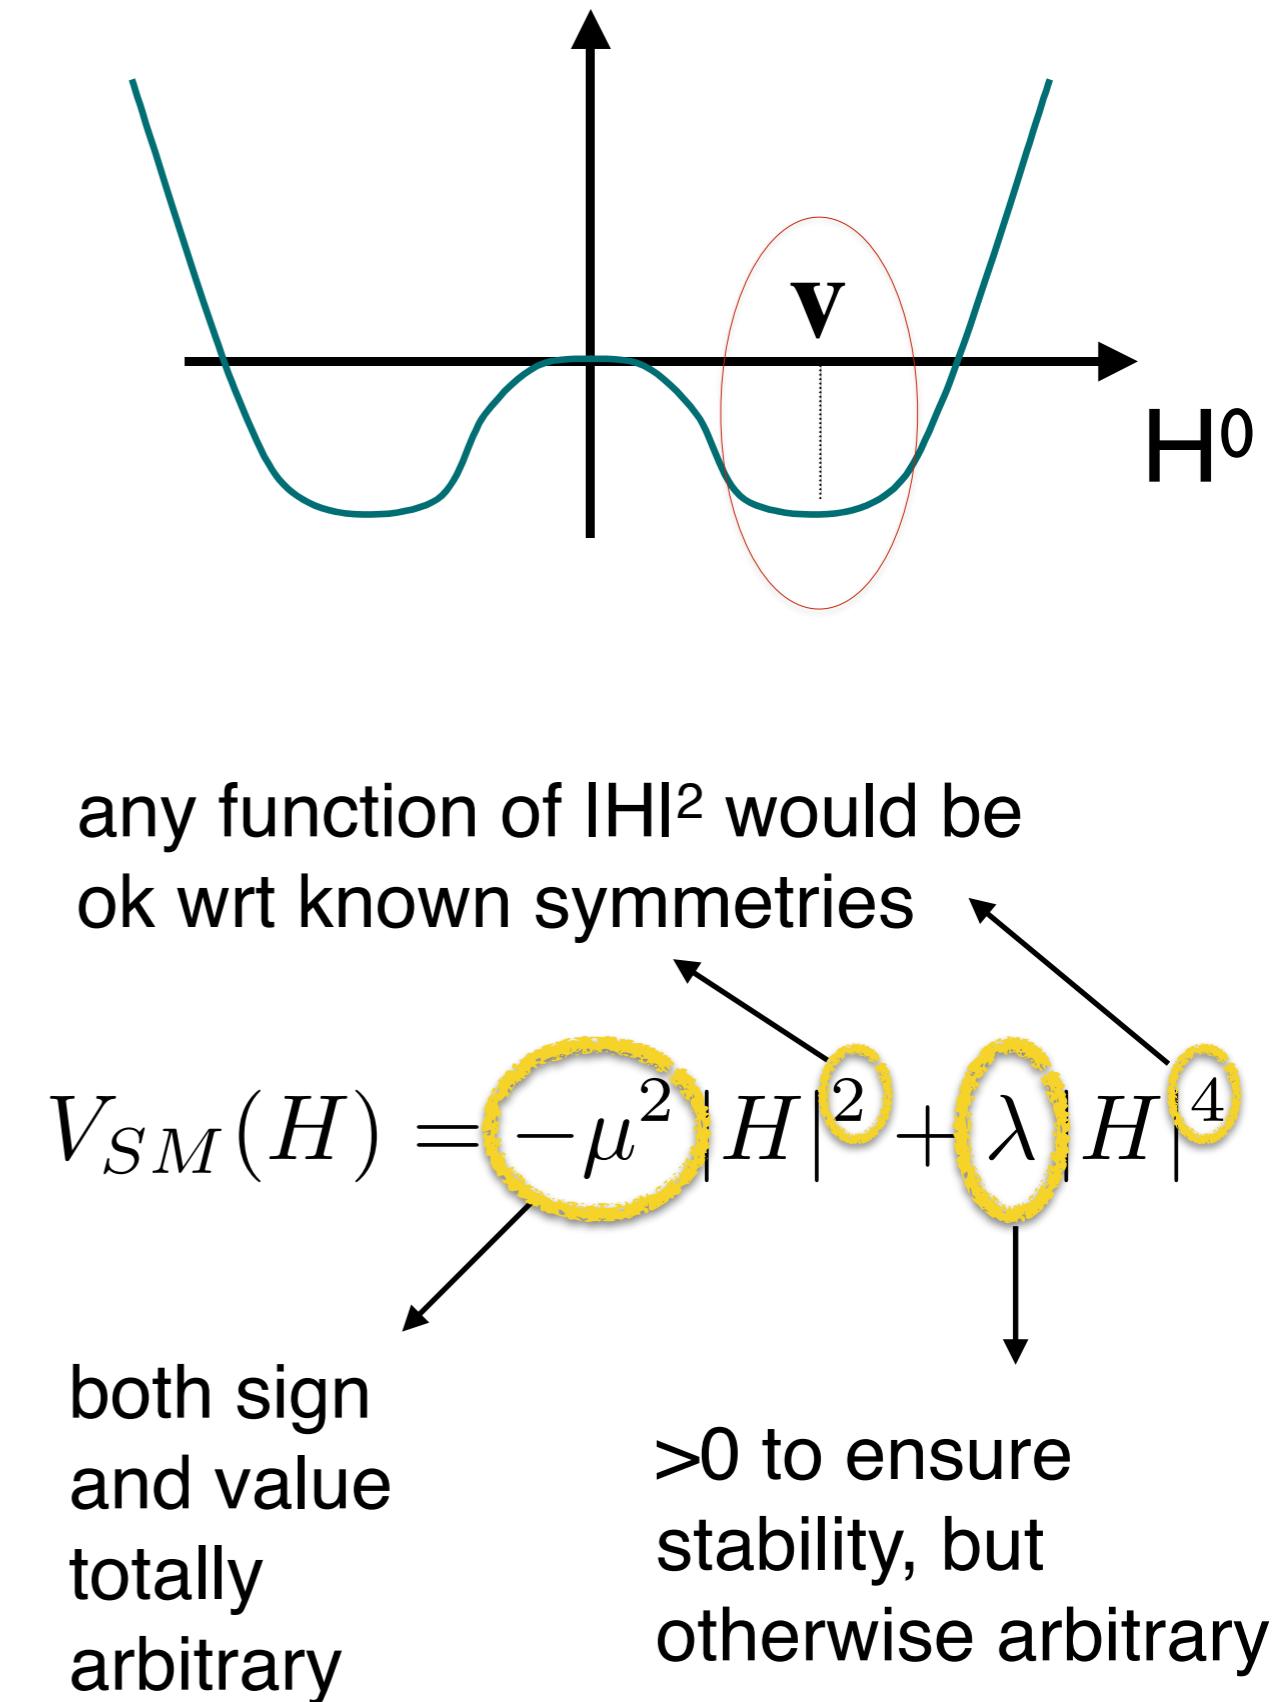

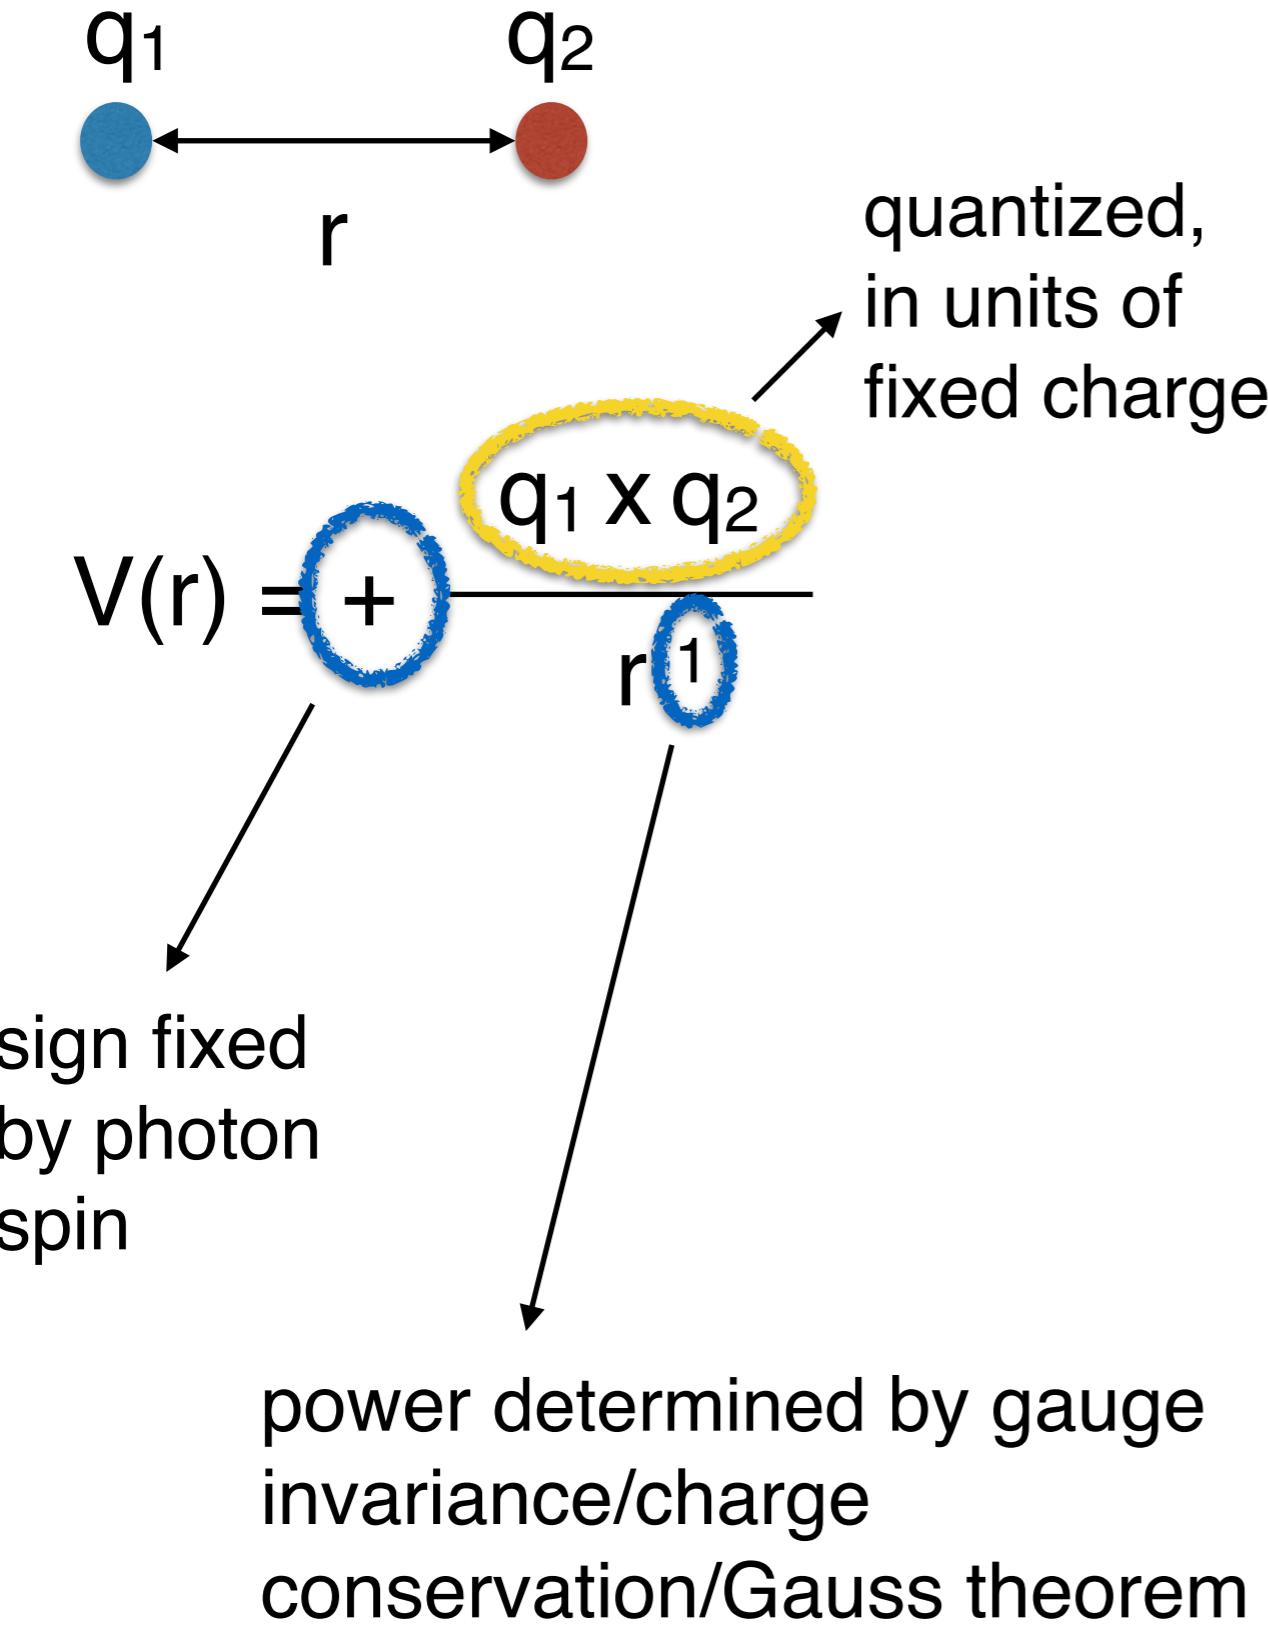

Who ordered that ?

We must learn to appreciate the depth and the value of this question, which is set to define the future of collider physics

Who put it there?

Electromagnetic vs Higgs dynamics

a historical example: superconductivity

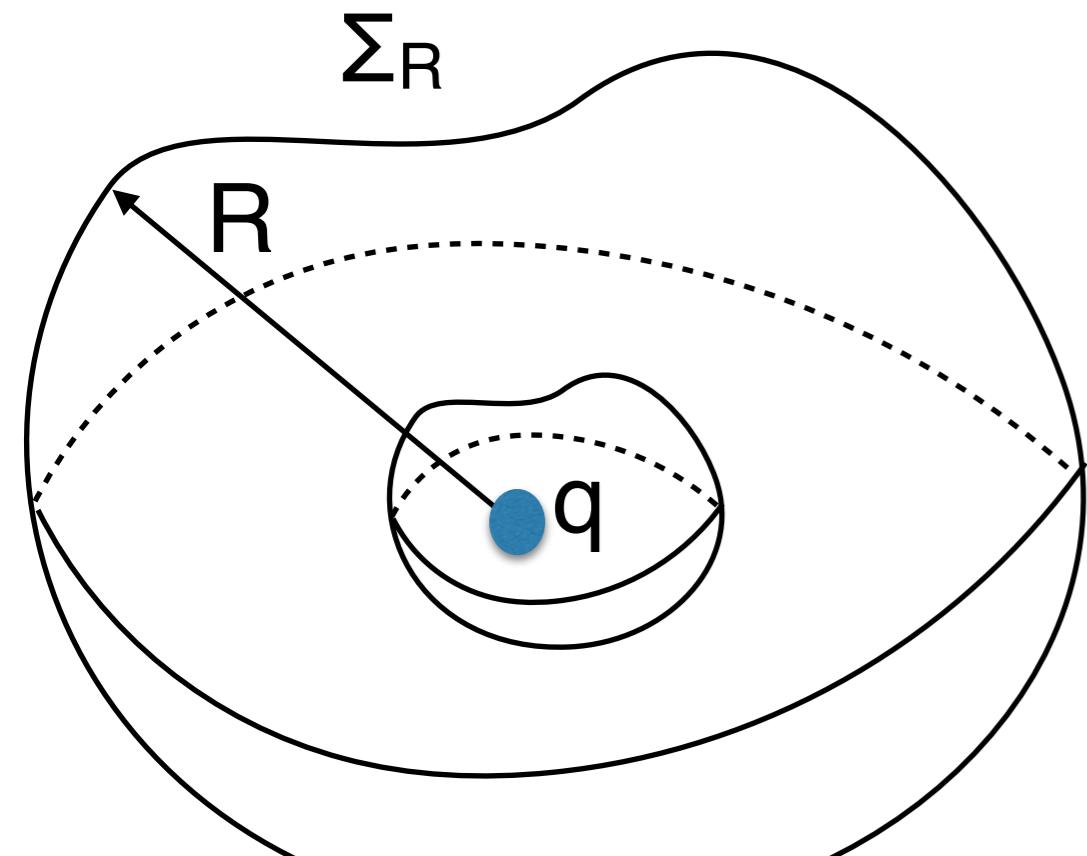

- The relation between the Higgs phenomenon and the SM is similar to the relation between superconductivity and the Landau-Ginzburg theory of phase transitions: a quartic potential for a bosonic order parameter, with negative quadratic term, and the ensuing symmetry breaking. If superconductivity had been discovered after Landau-Ginzburg, we would be in a similar situations as we are in today: an experimentally proven phenomenological model. But we would still lack a deep understanding of the relevant dynamics.
- For superconductivity, this came later, with the identification of e^-e^- Cooper pairs as the underlying order parameter, and BCS theory. In particle physics, we still don't know whether the Higgs is built out of some sort of Cooper pairs (composite Higgs) or whether it is elementary, and in either case we have no clue as to what is the dynamics that generates the Higgs potential. With Cooper pairs it turned out to be just EM and phonon interactions. With the Higgs, none of the SM interactions can do this, and **we must look beyond.**

examples of possible scenarios

- **BCS-like**: the Higgs is a composite object
- **Supersymmetry**: the Higgs is a fundamental field and
 - $\lambda^2 \sim g^2 + g'^2$, it is not arbitrary (MSSM, w/out susy breaking, has one parameter less than SM!)
 - potential is fixed by susy & gauge symmetry
 - EW symmetry breaking (and thus m_H and λ) determined by the parameters of SUSY breaking
- ...

Decoupling of high-frequency modes

E&M

$$\int_{\Sigma_R} \vec{\nabla} V_q \cdot d\vec{\sigma} = 4\pi q, \quad \forall R$$

short-scale physics does not alter the charge seen at large scales

$$V_{SM}(H) = -\mu^2 |H|^2 + \lambda |H|^4$$

$$\text{---} \bullet \text{---} = \text{---} \mu^2 \text{---} + \text{---} g^2 \text{---} W,H + \text{---} t \text{---} - y_t^2$$

$$\Delta\mu^2 \sim (\mathbf{c}_B m_B^2 - \mathbf{c}_F m_F^2) \times (\Lambda / v)^2$$

$$\begin{aligned} h &= h \\ h &= h \\ h &= h \\ h &= h \\ \lambda_{\text{ren}} &= \lambda \\ \lambda &= \lambda \\ -y_t^4 &= -y_t^4 \\ \lambda^4 &= \lambda^4 \end{aligned}$$

$$\Rightarrow \frac{d\lambda}{d \log \mu} \propto \lambda^4 - y_t^4 \propto a m_H^4 - b m_t^4$$

high-energy modes can change size and sign of both μ^2 and λ , dramatically altering the stability and dynamics

bottom line

- To predict the properties of EM at large scales, we don't need to know what happens at short scales
- The Higgs dynamics is sensitive to all that happens at any scale larger than the Higgs mass !!! A very **unnatural fine tuning** is required to protect the Higgs dynamics from the dynamics at high energy
- This issue goes under the name of **hierarchy problem**
- Solutions to the hierarchy problem require the introduction of new symmetries (typically leading to the existence of new particles), which decouple the high-energy modes and allow the Higgs and its dynamics to be defined at the “natural” scale defined by the measured parameters v and m_H
⇒ **naturalness**

message

- Naturalness and the origin of the Higgs go hand in hand, and are unavoidably tied to BSM physics. They have provided so far an obvious setting for the exploration of the dynamics underlying the Higgs phenomenon.
- Lack of experimental evidence so far for a straightforward answer to naturalness, forces us to review our biases, and to take a closer look even at the most basic assumptions about Higgs properties
 - again, “who ordered that?”
 - in this perspective, even innocent questions like whether the Higgs gives mass also to 1st and 2nd generation fermions call for experimental verification, nothing of the Higgs boson can be given for granted
 - what we’ve experimentally proven so far are basic properties, which, from the perspective of EFT and at the current level of precision of the measurements, could hold in a vast range of BSM EWSB scenarios

➡ *the Higgs discovery does not close the book, it opens a whole new chapter of exploration, based on precise measurements of its properties, and relying on a future generation of colliders*

On the role of measurement

- Aside from exceptional moments in the development of the field, research is not about proving a theory is right or wrong, it's about finding out how things work
- We do not measure Higgs couplings precisely to **find** deviations from the SM. We measure them to **know** them!
- LEP's success was establishing SM's amazing predictive power!
- *Precision for the sake of it is not necessarily justified. Improving X10 the precision on $m(\text{electron})$ or $m(\text{proton})$ is not equivalent to improving X10 the Higgs couplings:*
 - $m(e) \Rightarrow$ just a parameter; $m(p) \Rightarrow$ just QCD dynamics; Higgs couplings $\Rightarrow ???$
- ... but who knows how important a given measurement can become, to assess the validity of a future theory?
 - Tycho Brahe (data) \Rightarrow Kepler (phenomenology) \Rightarrow Newton (theory)
 - Mercury's perihelion precession measurements vs GR: Einstein did not develop GR to explain Mercury's orbit. But those data were crucial to validate his theory!
 - the day some BSM signal is found somewhere, the available precision measurements, whether they agree or deviate from the SM, will be useful to establish the nature of the signal

Criteria to judge a future facility

- Guaranteed deliverables
- Extensive exploration potential
- Firm Yes/No answers to relevant questions

The FCC targets

- Guaranteed deliverables:
 - study of Higgs and top quark properties, and exploration of EWSB phenomena, with the best possible **precision and sensitivity**
- Exploration potential:
 - **enhanced mass reach** for direct exploration ($\text{pp@}100\text{TeV}$)
 - *E.g. match the mass scales for new physics that could be exposed via indirect precision measurements in the EW and Higgs sector*
 - exploit both direct (large Q^2) and indirect (precision) probes
- Provide firm Yes/No answers to questions like:
 - is there a TeV-scale solution to the hierarchy problem?
 - is DM a thermal WIMP?
 - could the cosmological EW phase transition have been 1st order?
 - could baryogenesis have taken place during the EW phase transition?
 - could neutrino masses have their origin at the TeV scale?
 - ...

The goals of the first FCC physics studies

- explore the measurement and discovery potential of the individual components of the programme
- guide the definition of accelerator layout/performance parameters (energies, luminosities, bunch structure, MDI, ...)
- identify the key experimental requirements, define the target detector performance parameters, provide benchmark studies for the evaluation of the detector performance
- identify targets for the progress of theoretical calculations
- take a broader look at the full programme, explore synergies and complementarities

Major events organized

FCC-ee

- 5th TLEP Workshop "TLEP physics and technology", Fermilab, 25-26 July 2013, <https://indico.cern.ch/event/246137/>
- 6th TLEP Workshop, CERN, 16-18 October 2013, <https://indico.cern.ch/event/257713/>
- FCC-ee/TLEP physics workshop (TLEP7), CERN, 19-21 June 2014, <https://indico.cern.ch/event/313708/>
- FCC-ee (TLEP) Physics Workshop (TLEP8), LPNHE Paris, 27-29 October 2014, <https://indico.cern.ch/ event/337673/>
- FCC-ee (TLEP) Physics Workshop (TLEP9), SNS Pisa, 3-5 February 2015, <https://indico.cern.ch/event/357188/>
- 1st FCC-ee mini-workshop on Detector Requirements, CERN, 17-18 June 2015, <https://indico.cern.ch/event/393093/>
- FCC-ee mini-workshop on "Precision Observables and Radiative Corrections", CERN, 13-14July 2015, <https://indico.cern.ch/event/387296/>
- First FCC-ee workshop on Higgs physics, CERN, 24-25 Sept. 2015, <https://indico.cern.ch/event/401590/>
- Workshop on high-precision α_s measurements: from LHC to FCC-ee, 12-13 October 2015, <https://indico.cern.ch/event/392530/>
- FCC-ee Mini-Workshop: "Physics Behind Precision", CERN, 2-3 February 2016, <https://indico.cern.ch/event/469561/>
- 10th FCC-ee Physics Workshop, CERN, CERN, 2-3 February 2016, <https://indico.cern.ch/ event/469576/>
- Parton Radiation and Fragmentation from LHC to FCC-ee, CERN, 21-22 Nov 2016, <https://indico.cern.ch/event/557400/>
- 2nd mini-workshop on FCC-ee detector requirements CERN, 23-24 November 2016, <https://indico.cern.ch/event/570415/>
- Mini workshop: Precision EW and QCD calculations for the FCC studies, CERN 12-13 January 2018, <https://indico.cern.ch/ event/669224/>
- FCC-ee mini-workshop on Flavours, CERN, 31 Jan.-1 Feb. 2018, <https://indico.cern.ch/event/687191/>
- 11th FCC-ee workshop: Theory and Experiments, CERN, 8 - 11 Jan 2019, <https://indico.cern.ch/event/766859/>

FCC-hh

- Ions at the Future Hadron Collider, Dec16-17 2013, <https://indico.cern.ch/event/288576/>
- BSM physics opportunities at 100 TeV, Febr 10-11 2014, <https://indico.cern.ch/event/284800/>
- 1st Future Hadron Collider Workshop, May 26-28 2014, <https://indico.cern.ch/event/304759>
- Ions at the Future Circular Collider, Sept 22-23 2014, <https://indico.cern.ch/event/331669/>
- Higgs & BSM at 100 TeV, March 11-13 2015, <https://indico.cern.ch/event/352868/>
- QCD, EW and tools at 100 TeV, Oct 7-9 2015, <https://indico.cern.ch/event/437912/>
- Dark Matter at a future hadron collider, Dec 4-6 2015, <https://indico.cern.ch/event/445743/>

FCC-eh

- LHeC and FCC-eh, CERN and Chavanne-de-Bogis, 24-26.6.2015, <https://indico.cern.ch/ event/356714/>
- LHeC and FCC-eh, CERN, 11-13.9.2017, <https://indico.cern.ch/event/639067/>
- Electrons for the LHC - LHeC/FCC-eh and PERLE, Orsay, 27-29.6.2018, <https://indico.cern.ch/event/698368/>

Joint

- LHC, FCC-ee, FCC-hh Interplay, 25 November 2016, <https://indico.cern.ch/event/ 573689/>
- 1st FCC Physics Workshop, January 16-20 2017, <https://indico.cern.ch/event/550509/>
- 2nd FCC Physics Workshop, January 15-19 2018, <https://indico.cern.ch/event/618254/>

... plus many events
worldwide dedicated
to physics at FCCs

Reports produced

FCC-ee

The measurement potential	13																																																																																																																																														
3 EW measurements	15																																																																																																																																														
3.1 Introduction	15																																																																																																																																														
3.2 FCC-ee	16																																																																																																																																														
3.2.1 Overview	16																																																																																																																																														
3.2.2 Electroweak Programme at the Z^0 peak	16																																																																																																																																														
3.2.3 The Number of Light Neutrino Species	19																																																																																																																																														
3.2.4 The W^+W^- and $t\bar{t}$ Thresholds	19																																																																																																																																														
3.2.5 Summary and Demands on Theoretical Calculations	20																																																																																																																																														
3.3 FCC-hh	23																																																																																																																																														
3.3.1 Drell-Yan Processes	23																																																																																																																																														
3.3.2 Gauge Boson Pair Production	24																																																																																																																																														
3.3.3 Gauge boson(s) Production via Vector Boson Scattering and Fusion	25																																																																																																																																														
3.4 FCC-eh	26																																																																																																																																														
4 Higgs measurements	31																																																																																																																																														
FCC Physics Opportunities																																																																																																																																															
4.1 Introduction	31																																																																																																																																														
4.2 FCC-ee	32																																																																																																																																														
4.2.1 Model-independent Coupling Determination from the Higgs Branching Fractions	32																																																																																																																																														
4.2.2 The Top Yukawa Coupling and the Higgs Self-Coupling	34																																																																																																																																														
4.3 FCC-hh	36																																																																																																																																														
4.3.1 Longitudinal Vector Boson Scattering	42																																																																																																																																														
4.4 HE-LHC	43																																																																																																																																														
4.5 FCC-eh	44																																																																																																																																														
4.5.1 SM Higgs Decays	45																																																																																																																																														
4.5.2 Determination of Higgs Couplings	46																																																																																																																																														
4.5.3 Top and Invisible Higgs Couplings	47																																																																																																																																														
4.5.4 Exotic Higgs Phenomena	47																																																																																																																																														
5 QCD measurements	49																																																																																																																																														
5.1 FCC-ee	49																																																																																																																																														
5.1.1 High-Precision α_s Determination	49																																																																																																																																														
5.1.2 High-Precision Parton Radiation Studies	50																																																																																																																																														
5.1.3 High-precision Non-Perturbative QCD	52																																																																																																																																														
5.2 FCC-hh	53																																																																																																																																														
5.3 FCC-eh	56																																																																																																																																														
5.3.1 Parton Distributions	57																																																																																																																																														
5.3.2 Small x Physics	62																																																																																																																																														
6 Top quark measurements	67																																																																																																																																														
6.1 Introduction	67																																																																																																																																														
6.2 FCC-ee	67																																																																																																																																														
6.2.1 Precision Measurements at the Threshold	68																																																																																																																																														
6.2.2 Precision Measurement of the Top Electroweak Couplings	68																																																																																																																																														
6.2.3 Search for FCNC in Top Production or Decay	69																																																																																																																																														
6.3 FCC-hh	70																																																																																																																																														
6.3.1 Single Top Production	71																																																																																																																																														
6.3.2 Associated Production	72																																																																																																																																														
6.3.3 Rare Top Decays	74																																																																																																																																														
6.4 FCC-eh	74																																																																																																																																														
6.4.1 Wtq Couplings	75																																																																																																																																														
6.4.2 FCNC Top Quark Couplings	76																																																																																																																																														
6.4.3 Other Top Quark Property Measurements and Searches for New Physics	77																																																																																																																																														
7 Flavour physics measurements	79																																																																																																																																														
7.1 FCC-ee	79																																																																																																																																														
7.1.1 Flavour Anomalies and Electroweak Penguins in $b \rightarrow s$ Quark Transitions	79																																																																																																																																														
7.1.2 Lepton Flavour Violation in Z-boson Decays and Tests of Lepton Flavour Universality	81																																																																																																																																														

7.1.3	Charged Lepton Flavour Violation in τ Lepton Decays	82	12.1	Introduction	123
7.1.4	Search for BSM Physics in $\Delta F = 2$ Quark Transitions	82	12.2	Discovering WIMPs: an Example	124
7.1.5	Additional Flavour Physics Opportunities	83	12.2.1	The Search for Disappearing Tracks at FCC-hh and FCC-eh	125
7.2	FCC-hh	84	12.3	Simplified Models: an Example	127
Interpretation and sensitivity to new physics		85	12.4	Exploring the Dark Sector	128
8	Global EFT Fits to EW and Higgs Observables	87	12.5	Summary	129
8.1	Introduction	87	13	Searches for Massive Neutrinos	131
8.2	Electroweak Fit at FCC-ee and FCC-eh	88	13.1	Introduction	131
8.3	Electroweak Observables at FCC-hh	90	13.2	Searches at FCC	132
8.4	Higgs Couplings Fit	91	13.3	Summary	134
8.4.1	On-Shell Higgs Couplings at FCC	92	14	High Energy Probes of Flavour Anomalies	135
8.4.2	Higgs Differential Measurements at FCC-hh	95	14.1	Introduction	135
8.5	Global Fits	97	14.2	Naive Z' and Leptoquark Models	136
9	The Origin of the Higgs Mass	101	14.3	Projected Sensitivity at FCC-hh	137
9.1	Introduction	101	14.4	Summary	138
9.2	Supersymmetry	101	15	Searches for Other BSM Phenomena	139
9.2.1	Direct Stop Search at FCC-hh	103	15.1	Introduction	139
9.3	Composite Higgs	103	15.2	Low-mass Signatures	139
9.4	Neutral Naturalness	105	15.2.1	Exotic Higgs Decays	139
10	The Nature of the Higgs Potential	107	15.2.2	Exotic Z Decays	141
10.1	Introduction	107	15.3	High-Energy Signatures	142
10.2	Origins of a Modified Higgs Self-coupling	108	15.3.1	s -channel Resonances in pp	142
10.3	Higgs Self-Coupling Probes at FCC	108	15.3.2	FCC-hh: Pair Production	143
10.4	FCC-ee: Indirect Probe	109	15.3.3	FCC-eh: Leptoquarks	144
10.5	FCC-hh: Direct Probes	110	15.4	Summary	144
10.5.1	$gg \rightarrow HH \rightarrow b\bar{b}\gamma\gamma$	111	Physics with heavy ions	144	
10.5.2	Other Final States in $gg \rightarrow HH$	113	16	Physics with Heavy Ions	147
10.5.3	Other Probes of Multi-Linear Higgs Interactions	114	16.1	Introduction	147
10.6	Double Higgs Production at FCC-eh	115	16.2	QGP Studies: Bulk Properties and Soft Observables	148
10.7	Summary	116	16.2.1	Global Characteristics of Pb–Pb Collisions	148
11	Studies of the EW Phase Transition	117	16.2.2	Collective Phenomena from Heavy-Ion to pp Collisions	149
11.1	Introduction	117	16.3	QGP Studies: Hard Probes	150
11.2	The Electroweak Phase Transition	117	16.3.1	Jet Quenching	150
11.3	Collider Probes	118	16.3.2	Heavy Flavour and Quarkonia	152
11.4	Summary	122	16.4	Nuclear PDF Measurements and Search For Saturation	154
12	Searches for Dark Matter and Dark Sectors	123	16.4.1	Studies in Hadronic pA and AA Collisions	154
			16.4.2	Exclusive Photoproduction of Heavy Quarkonia	157
			16.4.3	Electron-Nucleus Collisions	158
			16.5	Contributions to Other Sectors of High-Energy Physics	160
			16.5.1	$\gamma\gamma$ Collisions	160
			16.5.2	Fixed-Target Collisions Using the FCC proton and Pb Beams	161

what's been left out of the CDR studies

- few examples. Eg
 - exhaustive study of opportunities with the injector complex (see <https://arxiv.org/abs/1706.07667> for some examples)
 - systematic study of dedicated experiments at the two low-lumi pp IP, beyond FCC-eh (eg LHCb', HI, ...)
 - more systematic studies of flavour physics at the Z peak, at 100 TeV, with injectors
 - studies of additional physics scenarios
 - etc.etc.

There is still plenty of work left, to unveil new physics opportunities, to characterize in more detail the physics potential already examined, to develop new detector concepts and optimize their designs, ...
