

To start: personal reflections

- “WIMP miracle” and “idea” that electroweak energy scale is something “special”.
 - direct search $O(1)$ to $O(10)$ TeV
 - LHC future pp colliders
 - HL-LHC Muon colliders
 - (e^+e^- colliders) \vdots
- Indirect search to have better ideas for the energy scale (more prudent approach?), and to gain deeper understanding of SM and beyond
 - HE e^+e^- colliders, flavour factories, ...

More reflections

- Strategies for “particle physics”, “European particle physics”, “CERN”, ..., and also “LC community”
→ ideally, they should be identical/very similar ...
- Some problems are location independent, e.g. money, and some are not, e.g. LC has only one interaction region.
- Tactics should be for realizing the strategy. Tactics without strategy or driving the strategy are not good.

Final comment before starting discussion

- Reminding motivations for this meeting:
 - Could we form a common position of the LC community to be presented at the Granada symposium?
 - The contents of the document being discussed here.
But who are the audience for this document?
For example: internal document first, then another document for the external audience?
 - How should we continue the LC activities beyond 2019?
