LHC heat loads

Heat loads in LHC: sectors

In Run 2 we observed **spread in heat loads:**

■ among **sectors**

Heat loads in LHC: cells

In Run 2 we observed **spread in heat loads:**

- among **sectors**
- among **cell**

S23 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Heat loads in LHC: beam screens

In Run 2 we observed **spread in heat loads**:

- among **sectors**
- among **cell**
- among **beam screens in same magnets**

Heat loads in LHC: magnets

In Run 2 we observed **spread in heat loads**:

- among **sectors**
- among **cell**
- among **beam screens in same magnets**
- among **magnets**

Cell 31L2 (equipped with extra thermometers)

At 450 GeV:	25 W	20 W	50 W	3 W
	Q	Dipole	Dipole	Dipole
At 6.5 TeV:	5 W	30 W	70 W	8 W

Heat loads in LHC: why different?

In Run 2 we observed **spread in heat loads**:

- among **sectors**
- among **cell**
- among **beam screens in same magnets**
- among **magnets**

Hypothesis:

the differences in HL are caused by different SEY

SEY models

- Using simulations we can estimate SEY from measured heat loads

Outline

- Recap previous reports
- Cell-by-cell heat loads
- Summary: Where are we?

Cell-by-cell: finding SEY values

Hypothesis: the differences among cells are caused by different SEY

- Find modeled SEY corresponding to the measured heat loads in each cell
 - assuming uniform SEY along the cell

Cell-by-cell: 2012 vs 2017

S12 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

S23 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

S34 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

S45 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

S56 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

S67 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

S78 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

S81 e-cloud heat load with 1.0 p/bunch beam at 450GeV
(fills 3438, 15 Dec 2012 05:20 and 6786, 13 Jun 2018 11:03)

Cell-by-cell: 2012 vs 2017

In 2017

- still most of the ring is at 1.2-1.25 SEY
- Run 2 tail expands up to SEY 1.5-1.55

S12 HL intensity dependence (high HL)

Average over the fitted SEY cell-by-cell to compare with experiment at other filling schemes and energies

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

- cell-by-cell fit S12 (std)
- - - cell-by-cell fit S12 (8b4e)
- ⋯ cell-by-cell fit S12 (12b)
- ◆ measured S12 (std)
- ◇ measured S12 (8b4e)
- ◇ measured S12 (12b)

S12 HL contributions

Average over the fitted SEY cell-by-cell to compare with experiment at other filling schemes and energies

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

- cell-by-cell fit S12 (std)
- ◆ measured S12 (std)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S12 HL contributions

Average over the fitted SEY cell-by-cell to compare with experiment at other filling schemes and energies

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with *8b4e* beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S12 (8b4e)
- ◇ measured S12 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S67 HL intensity dependence (low HL)

Average over the fitted SEY cell-by-cell to compare with experiment at other filling schemes and energies

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

- cell-by-cell fit S67 (std)
- - - cell-by-cell fit S67 (8b4e)
- ⋯ cell-by-cell fit S67 (12b)
- ▲ measured S67 (std)
- △ measured S67 (8b4e)
- △ measured S67 (12b)

S67 HL contributions

Average over the fitted SEY cell-by-cell to compare with experiment at other filling schemes and energies

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

- cell-by-cell fit S67 (std)
- ▲ measured S67 (std)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S67 HL contributions

Average over the fitted SEY cell-by-cell to compare with experiment at other filling schemes and energies

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with *8b4e* beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S67 (8b4e)
- △ measured S67 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

Cell-by-cell fit results

Assuming uniform SEY along the cell first fit attempts show:

- the fitted SEY values reach 1.55-1.6 in some cells
- on the arc level improve agreement at low load sectors compared to average arc SEY fit
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for the bump in HL dependence on intensity

Outline

- Recap previous reports
- Cell-by-cell heat loads
- Summary: Where are we?

Summary: where are we?

Observed differences in heat loads in LHC sectors were analyzed

- first SEY models describing the observations are available

ARCS

CELLS

Magnets (31L2)

Beam Screens

- SEY fitting on cell-by-cell level assuming **uniform SEY within the cell** instead of uniform over the whole sector
 - **better represents** the intensity scan **data** with all tested filling schemes and energies
 - shows that quadrupoles are responsible for the heat load peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

Planned:

- look more into cell-by-cell
- look into individual beam screens cell-by-cell

Latest MD2018 with high intensity 8b4e beams proved them to be a good back-up filling scheme for higher intensity!

Thank you

EXTRA

S12 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

S12 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

S12 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with $8b4e$ beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S12 (8b4e)
- ◇ measured S12 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S23 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

S23 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

- cell-by-cell fit S23 (std)
- measured S23 (std)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S23 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with $8b4e$ beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S23 (8b4e)
- measured S23 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S34 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

- cell-by-cell fit S34 (std)
- - - cell-by-cell fit S34 (8b4e)
- ⋯ cell-by-cell fit S34 (12b)
- measured S34 (std)
- measured S34 (8b4e)
- measured S34 (12b)

S34 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

- cell-by-cell fit S34 (std)
- measured S34 (std)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S34 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Very low HL with *8b4e* beam. Quads are main contributors int $< 1.2 \times 10^{11}$, then drifts

- cell-by-cell fit S34 (8b4e)
- measured S34 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S45 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

S45 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

- cell-by-cell fit S45 (std)
- ▲ measured S45 (std)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S45 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with $8b4e$ beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S45 (8b4e)
- ▴ measured S45 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S56 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

S56 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

- cell-by-cell fit S56 (std)
- ▲ measured S56 (std)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S56 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with $8b4e$ beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S56 (8b4e)
- △ measured S56 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S67 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

S67 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

- cell-by-cell fit S67 (std)
- ▲ measured S67 (std)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S67 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with $8b4e$ beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S67 (8b4e)
- △ measured S67 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S78 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

S78 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

S78 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with $8b4e$ beam int $< 2.0 \times 10^{11}$

- cell-by-cell fit S78 (8b4e)
- measured S78 (8b4e)
- e-cloud in drifts
- e-cloud in dipoles
- e-cloud in quadrupoles

S81 HL intensity dependence

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities

S81 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch

S81 HL contributions

- Data better represented if using the cell-by-cell SEY averaging
- HL drops or changed insignificantly at higher bunch intensities
- Quadrupoles are responsible for HL peak in intensity region $1.0 - 2.0 \times 10^{11}$ p/bunch
- Quadrupoles are main contributors with $8b4e$ beam int $< 2.0 \times 10^{11}$
