

# Quark Matter 2019 - the XXVIIIth International Conference on Ultra-relativistic Nucleus-Nucleus Collisions

Contribution ID: 448

Type: Oral Presentation

## Deciphering the $z_g$ distribution in ultrarelativistic heavy ion collisions

*Wednesday, 6 November 2019 15:20 (20 minutes)*

Within perturbative QCD, we develop a new picture for the parton shower generated by a jet propagating through a dense quark-gluon plasma. In this picture, the vacuum-like parton branchings, as triggered by the parton virtualities, are factorized in time from the medium-induced emissions responsible for the energy loss by the jet. We implement this picture in a Monte Carlo generator that we use to study two phenomenologically important observables: the jet nuclear modification factor  $R_{AA}$  and the  $z_g$  distribution reflecting the jet substructure. In both cases, the outcome of our Monte Carlo simulations is in good agreement with the LHC measurements. We find that the energy loss by the jet is increasing with the jet transverse momentum, due to a rise in the number of partonic sources via vacuum-like emissions. This is a key element in our description of both  $R_{AA}$  and  $z_g$ . For the latter, we identify two main nuclear effects: incoherent jet energy loss and hard medium-induced emissions. As the jet transverse momentum increases, we predict a qualitative change in the ratio between the  $z_g$  distributions in PbPb and pp collisions: from increasing at small  $z_g$ , this ratio becomes slightly decreasing.
