Tier-1 CPU Usage - October 2018

Alastair Dewhurst

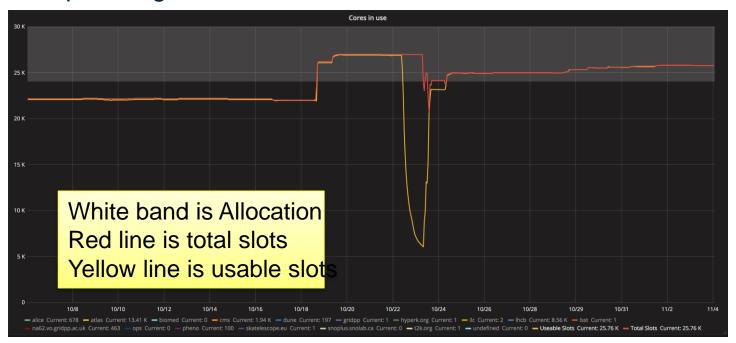

Introduction to give the VOs an understanding of their batch farm usage for the month.

- There are two separate questions that need answering:
 - Is sufficient capacity deployed?
 - Is the VO getting its fair share of resources?
- Deploying a sufficient amount of capacity is entirely a Tier-1 problem.
- Historically if a VO didn't get its fairshare it was assumed they hadn't submitted enough jobs for whatever reason.
 - More complicated brokerage (e.g. Multi-Core) means that it might be a Tier-1 issue.

Deployed Capacity

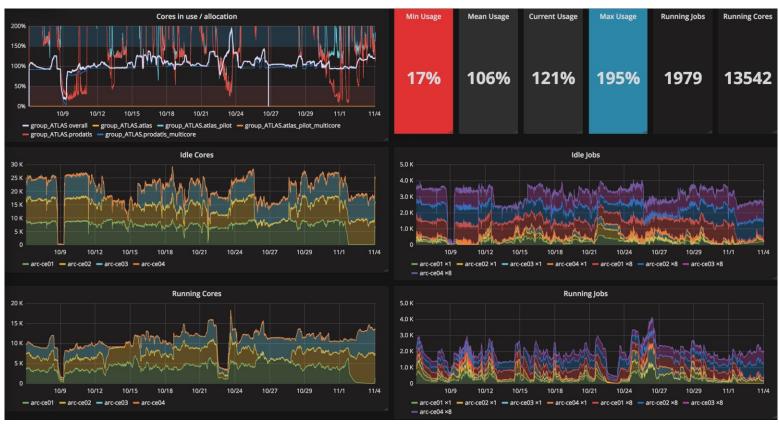

- Allocation for 2018 is 245196 HS06
- Average usable for October was 243905 HS06.
- HPE15 WN have been returned to production.
- Major drain + reboot of nodes on 23rd October for Security patching.

<u>ATLAS</u>

All OK.

<u>ALICE</u>

All OK.

<u>CMS</u>

- CMS have have not used their fairshare as they have not submited enough jobs.
 - Central CMS issue (many sites impacted).

LHCb

All OK.
