

4 IP progress

K. Oide

Many thanks to D. Shatilov and K. Ohmi

May 27, 2019 FCC-ee Physics Meeting

Possible issues

- ❖ Layout: perfect period 4 is the best solution:
 - ❖ How much is the geographical allowance for the tunnel?
 - ❖ FCC-hh must match to FCC-ee's new layout. Requirements for their collimation, injection, and detectors must be addressed.
 - ❖ Spaces for injection, beam abort, collimation, Compton polarimeter must be allocated.
- ❖ More beamstrahlung per damping:
 - ❖ Shorter beamstrahlung lifetime
 - ❖ Higher equilibrium energy spread, longer bunch length
- ❖ Smaller synchrotron tune per superperiod:
 - ❖ Narrower tune space for coherent x-z beam-beam instability, esp. at Z and W. (D. Shatilov, K. Ohmi)
- ❖ 2 by 2 bunch collision:
 - ❖ Tighter conditions for 3D flip-flop and coherent instability?
- ❖ Lattice/Dynamic aperture
- ❖ Emittance tuning, beam loss, collimation, etc.

4 IP: layout with perfect period-4

- ❖ Equal spacing between IPs:
 - ❖ Otherwise more than 4 bunches couple together.
- ❖ Complete period 4 periodicity, including RF (at least at $t\bar{t}$):
 - ❖ Better beam-beam, dynamic aperture, etc.
- ❖ RF must be at the midpoint of 2 IPs:
 - ❖ Beams cross over at the RF.

RF at the odd straight, symmetric: period 2 (2)

175 GeV, $\beta_{x,y}^* = (0.5 \text{ m}, 1 \text{ mm})$

- The dynamic aperture has shrunk.
- The momentum acceptance has reduced to $\pm 1.0\%$.
- If we put more conditions on the geometry & IR, it will be even worse.

Rough estimation of the luminosity

	Z		tt	
# of IPs	2	4	2	4
Particles/bunch [10^{11}]	1.7		2.3	
Bunches/beam	16640		48	
$\beta^*_{x/y}$ [m/mm]	0.15 / 0.8		1 / 1.6	
Long. damping [turns]	1270		40.8	
σ_z (SR/BS) [mm]	3.51 / 11.4	3.51 / 13.0	1.96 / 2.54	1.96 / 2.80
σ_δ (SR/BS) [%]	0.038 / 0.123	0.038 / 0.141	0.150 / 0.194	0.150 / 0.215
$\xi_{x/y}$	0.004 / 0.148	0.003 / 0.129	0.098 / 0.141	0.089 / 0.136
Luminosity/IP [$10^{34}/\text{cm}^2\text{s}$]	230	201	1.40	1.31

- ✧ Above are just geometrical calculations: no dynamics involved.
- ✧ Real estimation given by D. Shatilov & K. Ohmi are following.

Beamstrahlung for 4 IP vs. 2 IP

(bunch population as for 2 IP)

D. Shatilov

Z σ_δ and σ_z increased by $\sim 15\%$, luminosity drops by $\sim 15\%$. Here we are not yet limited by momentum acceptance, so the bunch population can be slightly increased.

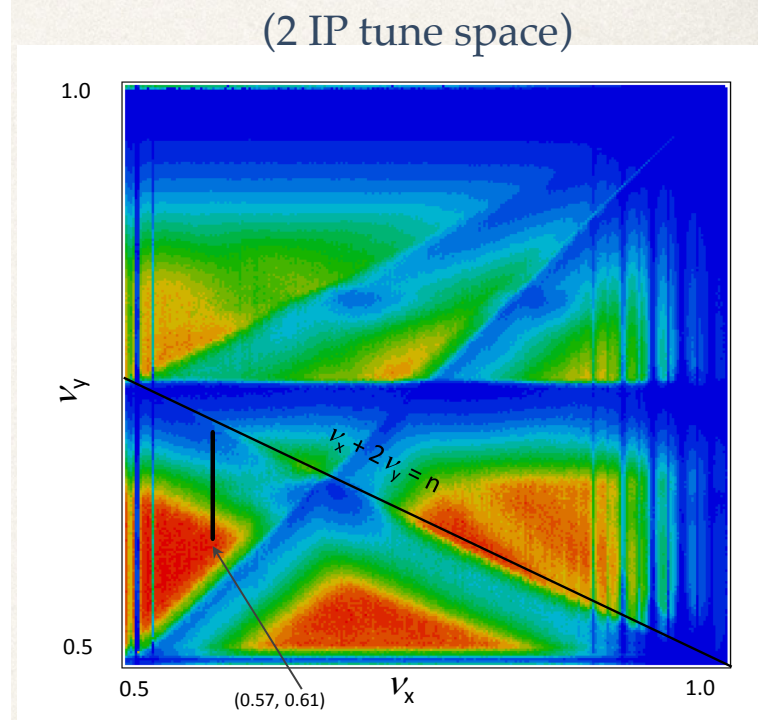

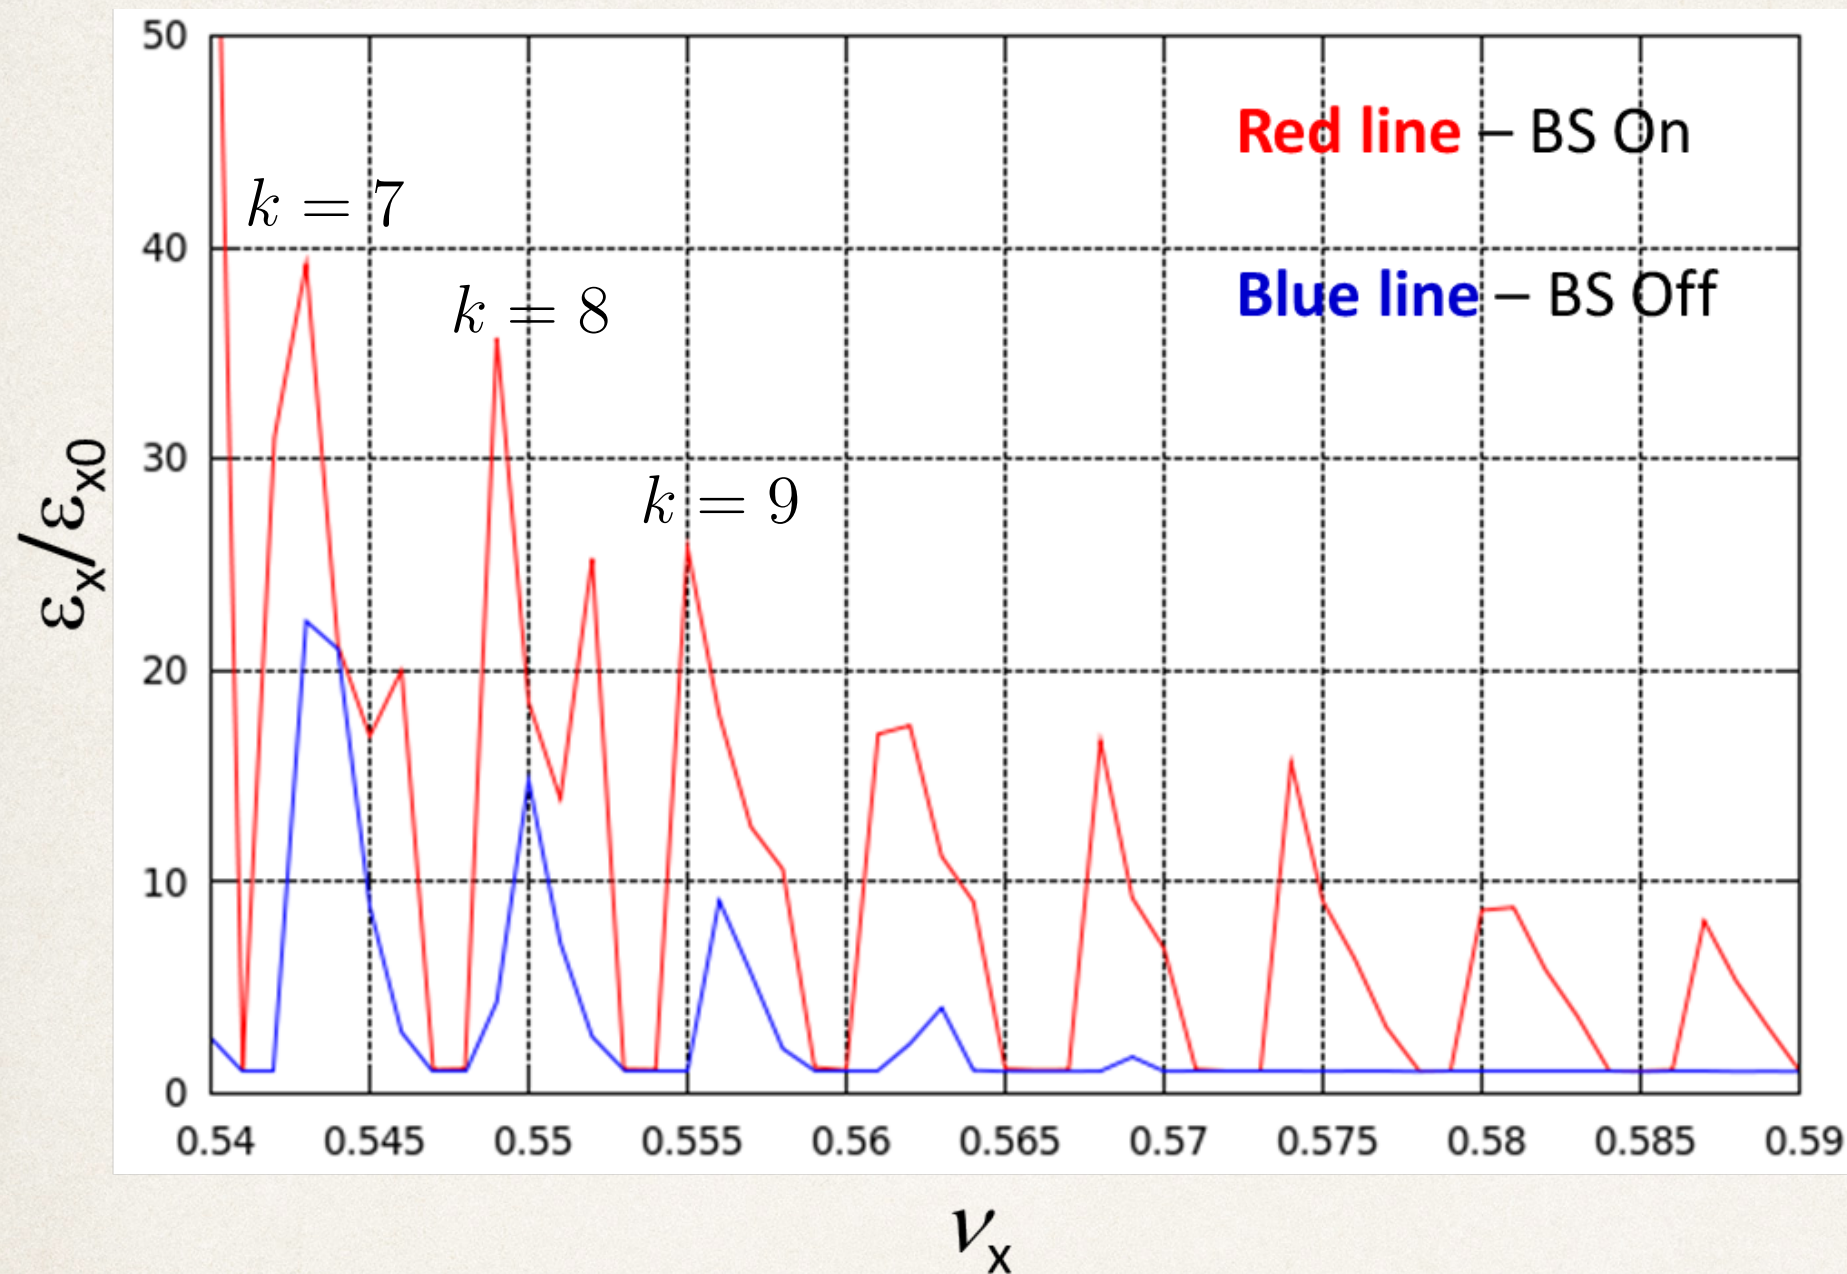

WW σ_δ and σ_z increased by $\sim 12\%$, luminosity drops by $\sim 12\%$. Here we are limited by HOM power, not by momentum acceptance. So, some increase in σ_δ is acceptable, while the bunch population should be the same.

HZ σ_δ and σ_z increased by $\sim 10\%$, luminosity drops by $\sim 12\%$. But here we are limited by momentum acceptance, so the bunch population should be decreased to preserve the lifetime. Luminosity will decrease by 15-20% (not yet done).

ttbar σ_δ and σ_z increased by $\sim 14\%$, luminosity drops by $\sim 9\%$. Again, we are limited by momentum acceptance, so the bunch population should be decreased to preserve the lifetime (not yet done).

Coherent beam-beam instability with 4 IP

D. Shatilov

$$2\nu_x + k\nu_z = N$$

$$\nu_z \approx -0.0125 \text{ @Z}$$

- ✧ The allowed tune space is tighten by beamstrahlung.
- ✧ Wigglers for higher energy spread may improve the situation.

Summary of 4IP simulations

- Ideal case of 2/4IP, in which perfect periodicity is kept, was studied.
- beam-beam head-tail (BBHT) instability limits the performance, because of smaller v_s per IP.
- Depending on parameters, choice of v_s helps the instability.
- Luminosity/IP for T and H are 10% loss compare with 2IP.
- Tune scan of Z is understudied, because simulation time is long.
- $\frac{1}{2}$ model gave same result as 2IP simulation.
- Probably, $\frac{1}{4}$ model gives the same result as 4IP simulation.
- Imperfection of each IP break periodicity.
- Bunch current unevenness $\sim 10\%$ gave weak effect in tt.

Dynamic aperture for 4 IP ($t\bar{t}$)

4 IP (in progress)

2 IP (CDR)

- ❖ Due to a half number (148 instead of 294) of sextupole families, it is more difficult to achieve the same momentum acceptance as the 2 IP.
- ❖ Additional octu-, deca-, dodeca-pole coils are added to 8 sextupoles close to each IP, using superconducting design are added for more degrees of freedom.
- ❖ Designs for other energies will follow.

Summary

- ❖ Beam-beam and lattice studies have been started for 4 IP scheme.
- ❖ A reduction of luminosity per IP up to -15% is expected so far.
- ❖ More studies must be done for beam-beam, layout, dynamic aperture, and all issues done for 2 IP.

Backups

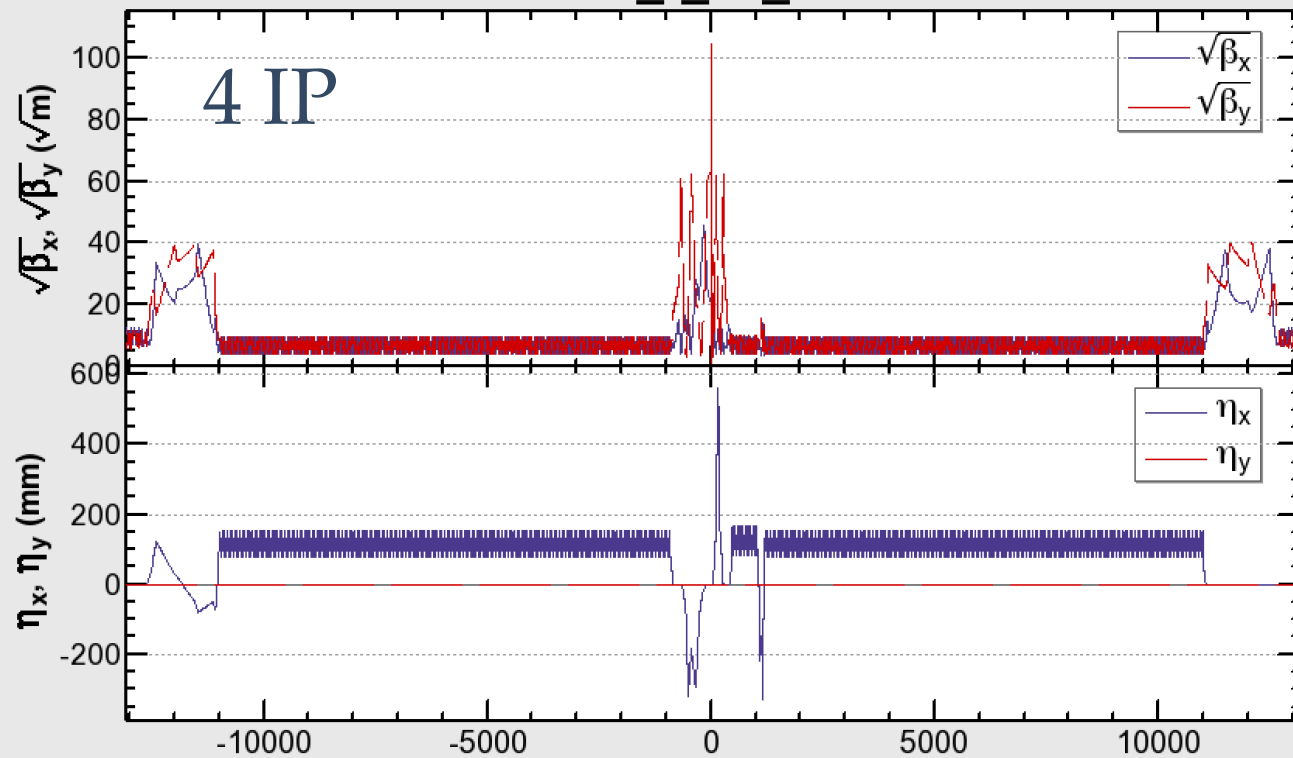

Ideal case: perfect period 4, RF at 45°

Period 4, 1/4 ring

175 GeV, $\beta^*_{x,y} = (0.5 \text{ m}, 1 \text{ mm})$

Period 2, 1/2 ring

FCCEE_t_79_10.sad

FCCEE_t_74_11.sad

- First a perfect period 4 ring is tried as a nearly ideal case.
- RF is placed at 45°, in the midpoint of arc (CEIK of FCC-hh).
- IR and RF sections, and the arc unit cell are identical to the 2 IP optics.
- The beam line does not match the FCC-hh tunnel.

Ideal case: perfect period 4, RF at 45° (2)

175 GeV, $\beta_{x,y}^* = (0.5 \text{ m}, 1 \text{ mm})$

- The effect on the dynamic aperture is small.
- $\pm 2\%$ momentum acceptance is maintained.

RF at the odd straight: perfect period 4

Period 4, 1/4 ring

175 GeV, $\beta_{x,y}^* = (0.5 \text{ m}, 1 \text{ mm})$

Period 4, 1/4 ring

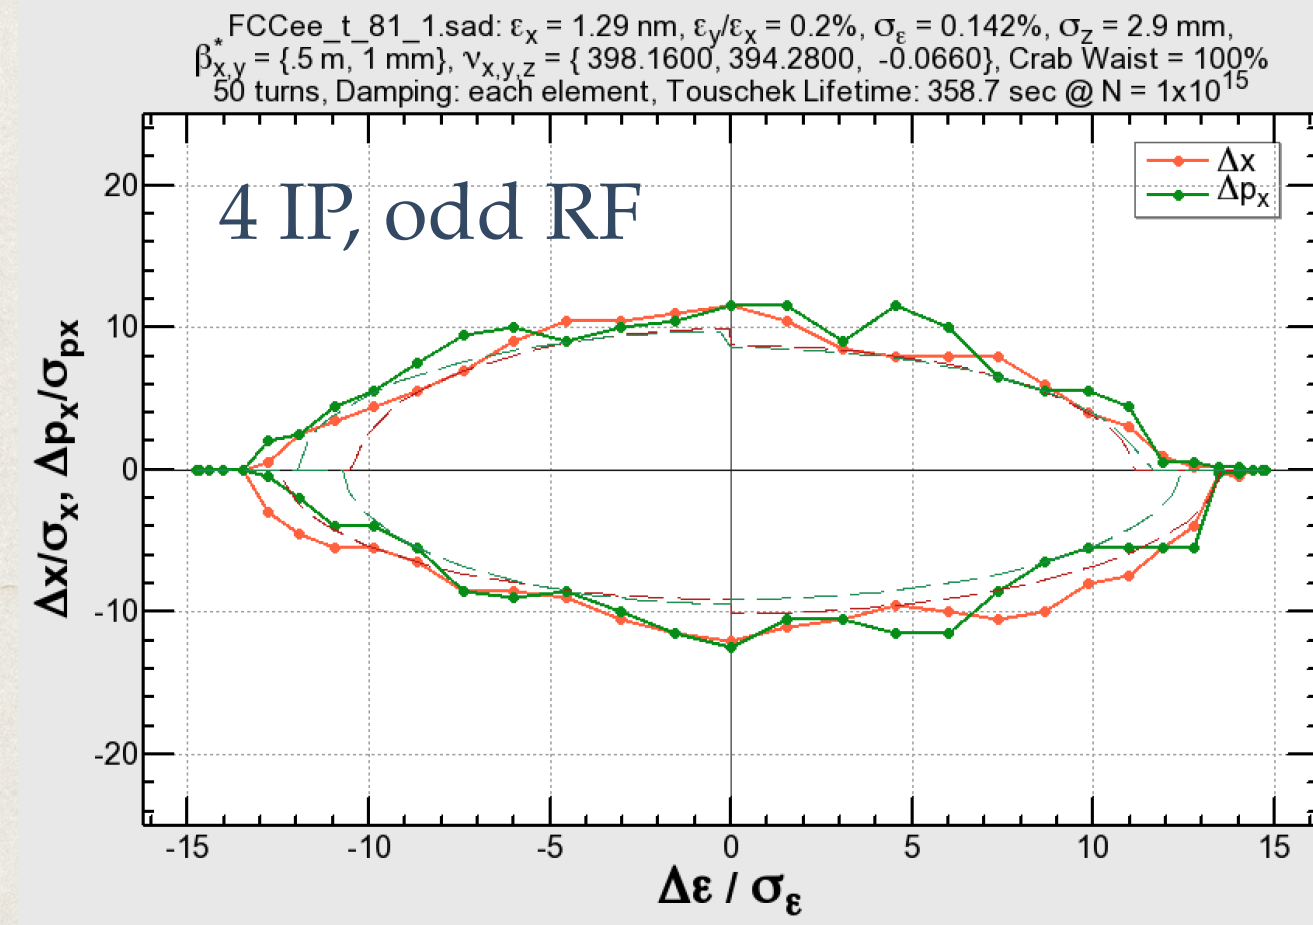

- As the RF should be placed at the short straights (B_H_) to utilize the FCC-hh layout.
- Still assume a complete period 4.
- The geometry is not yet close to FCC-hh.

RF at the odd straight: perfect period 4 (2)

175 GeV, $\beta_{x,y}^* = (0.5 \text{ m}, 1 \text{ mm})$

- The dynamic aperture has shrunk a little.
- The momentum acceptance has reduced to $\pm 1.7\%$.

RF at the odd straight, symmetric: period 2

Period 2, 1/2 ring

175 GeV, $\beta_{x,y}^* = (0.5 \text{ m}, 1 \text{ mm})$

Period 4, 1/4 ring

FCCee_t_80_3.sad

FCCee_t_74_11.sad

- Now place the RF symmetric, at sections BFHL.
- Then the periodicity is reduced to 2.
- The layout becomes closer to FCC-hh, but not perfect, since the length of the RF section is not correct, and the 4 IPs are still identical.

Summary for 4IP

- A preliminary design for optics with 4 IP is tried.
- Usable optics will be possible by locating the RF at 45° at the arc.
- Placing the RF at the short straights of FCC-hh reduces the dynamic aperture drastically.
- More investigation/ideas are needed for 4 IP with the geometry of FCC-hh.
