BIAS FRAME ANALYSIS

BIAS FRAMES ANALYSIS - UPDATE

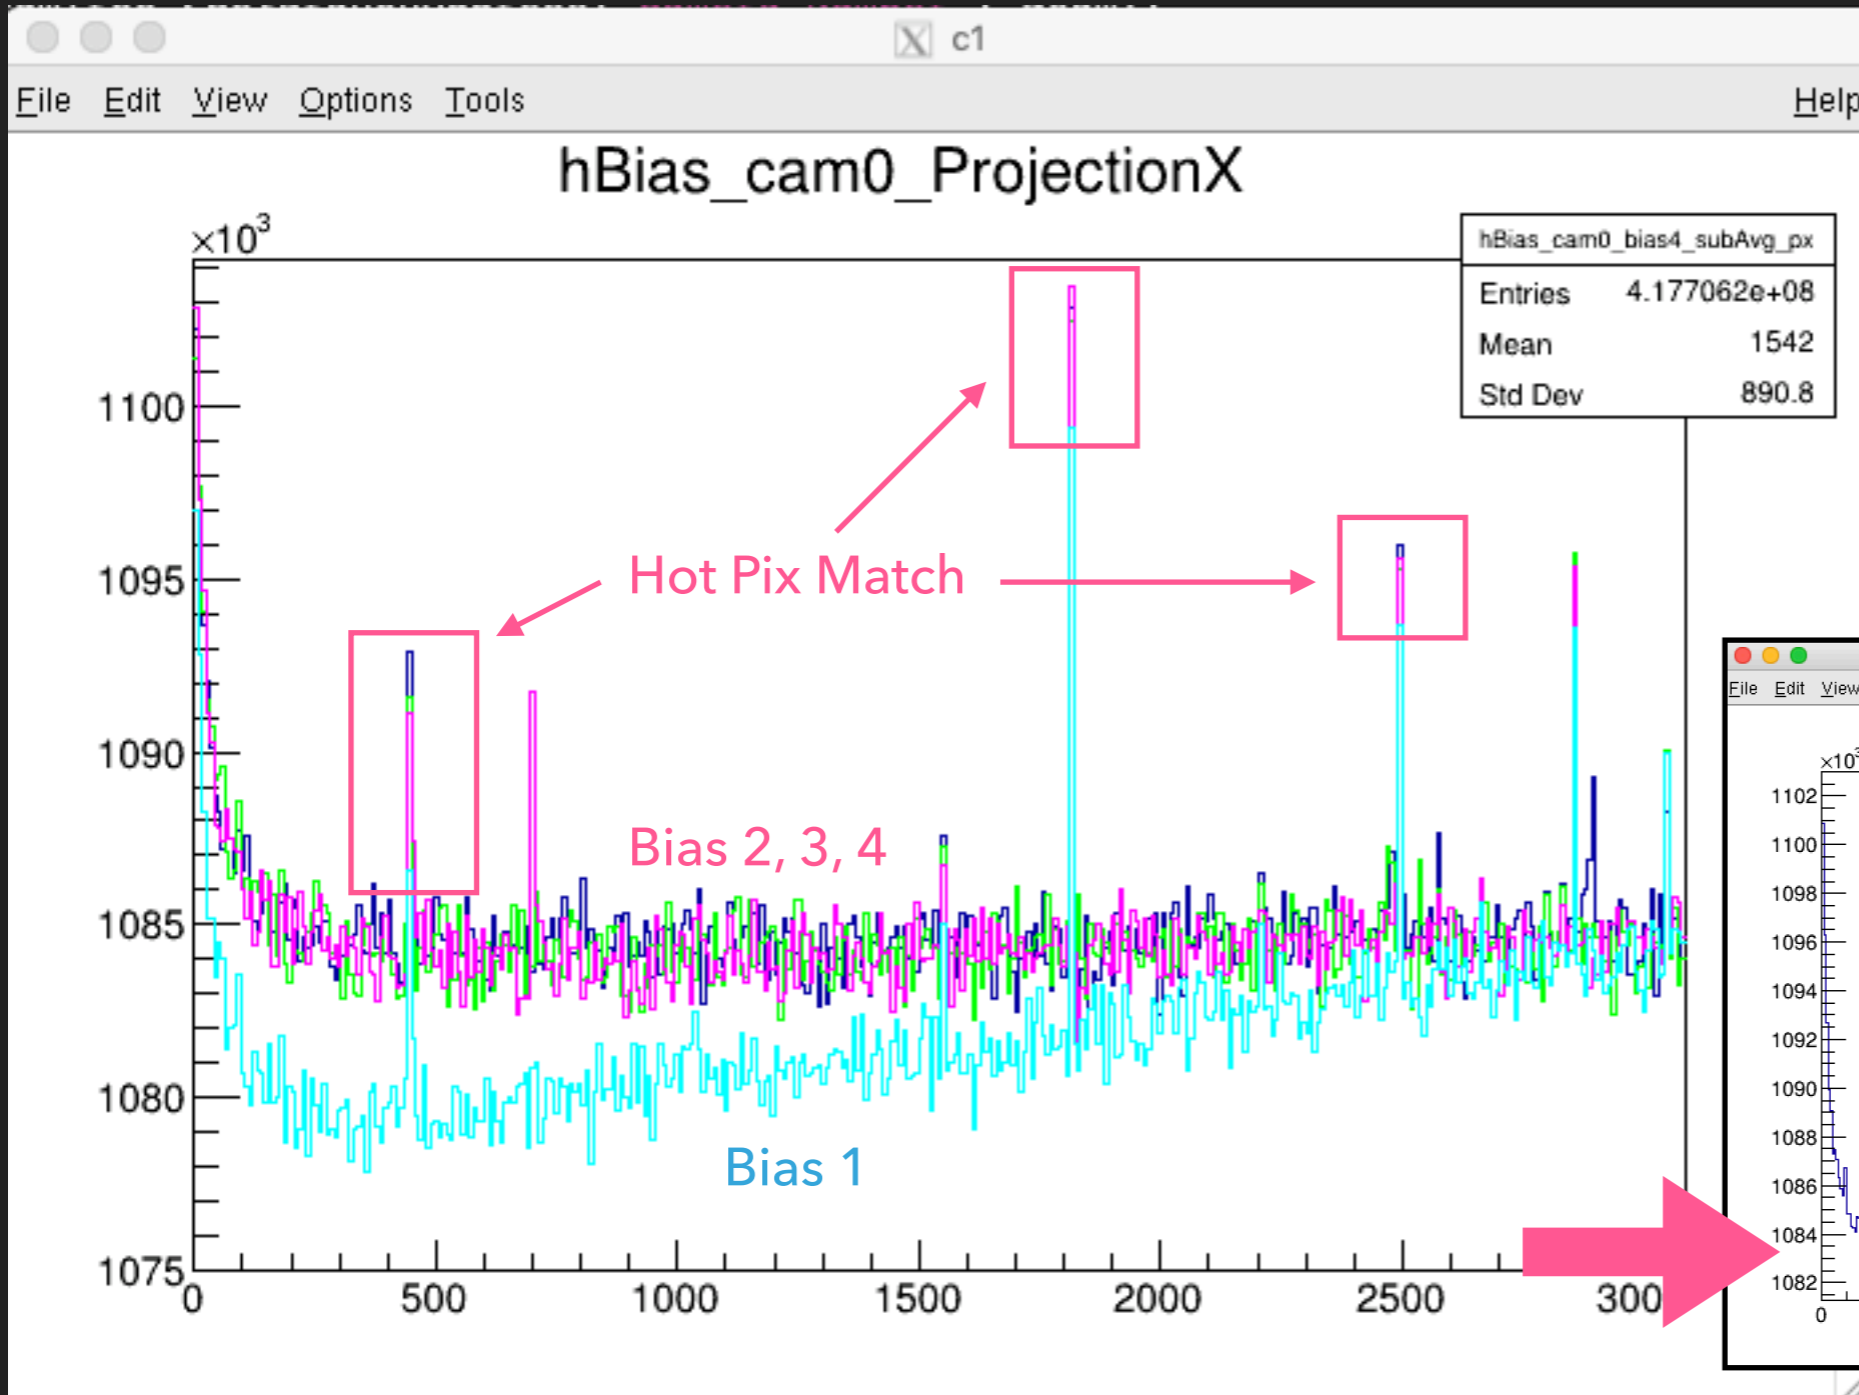

- ▶ Been working on the bias frames to look into why the average ADU seems to be approximately 2!
- ▶ Added some more info to be saved from LightSumSquare and written some macros to look further into this: Results to follow

BIAS FRAMES: CAM NUMBER SANITY CHECK

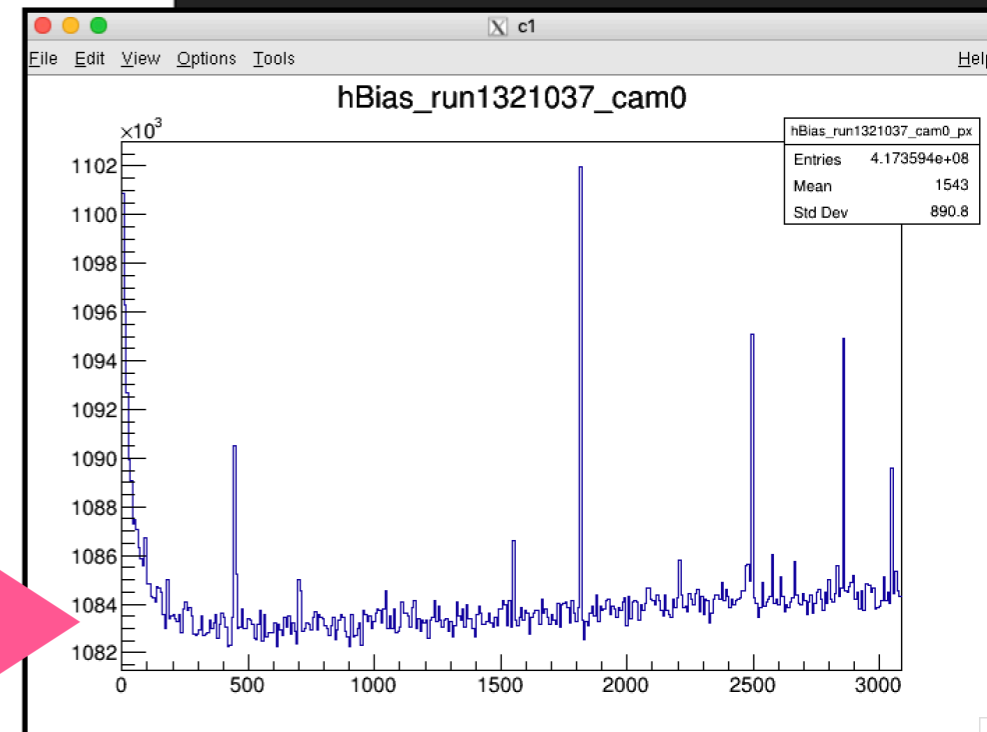

- ▶ Using hot pixels to sanity check the correct bias frames are being averaged together
- ▶ We can see that this is being done right and effects are produced from mismatching

BIAS FRAMES: BIAS 1, 2, 3 AND 4 PROJECTIONX() OVERLAY

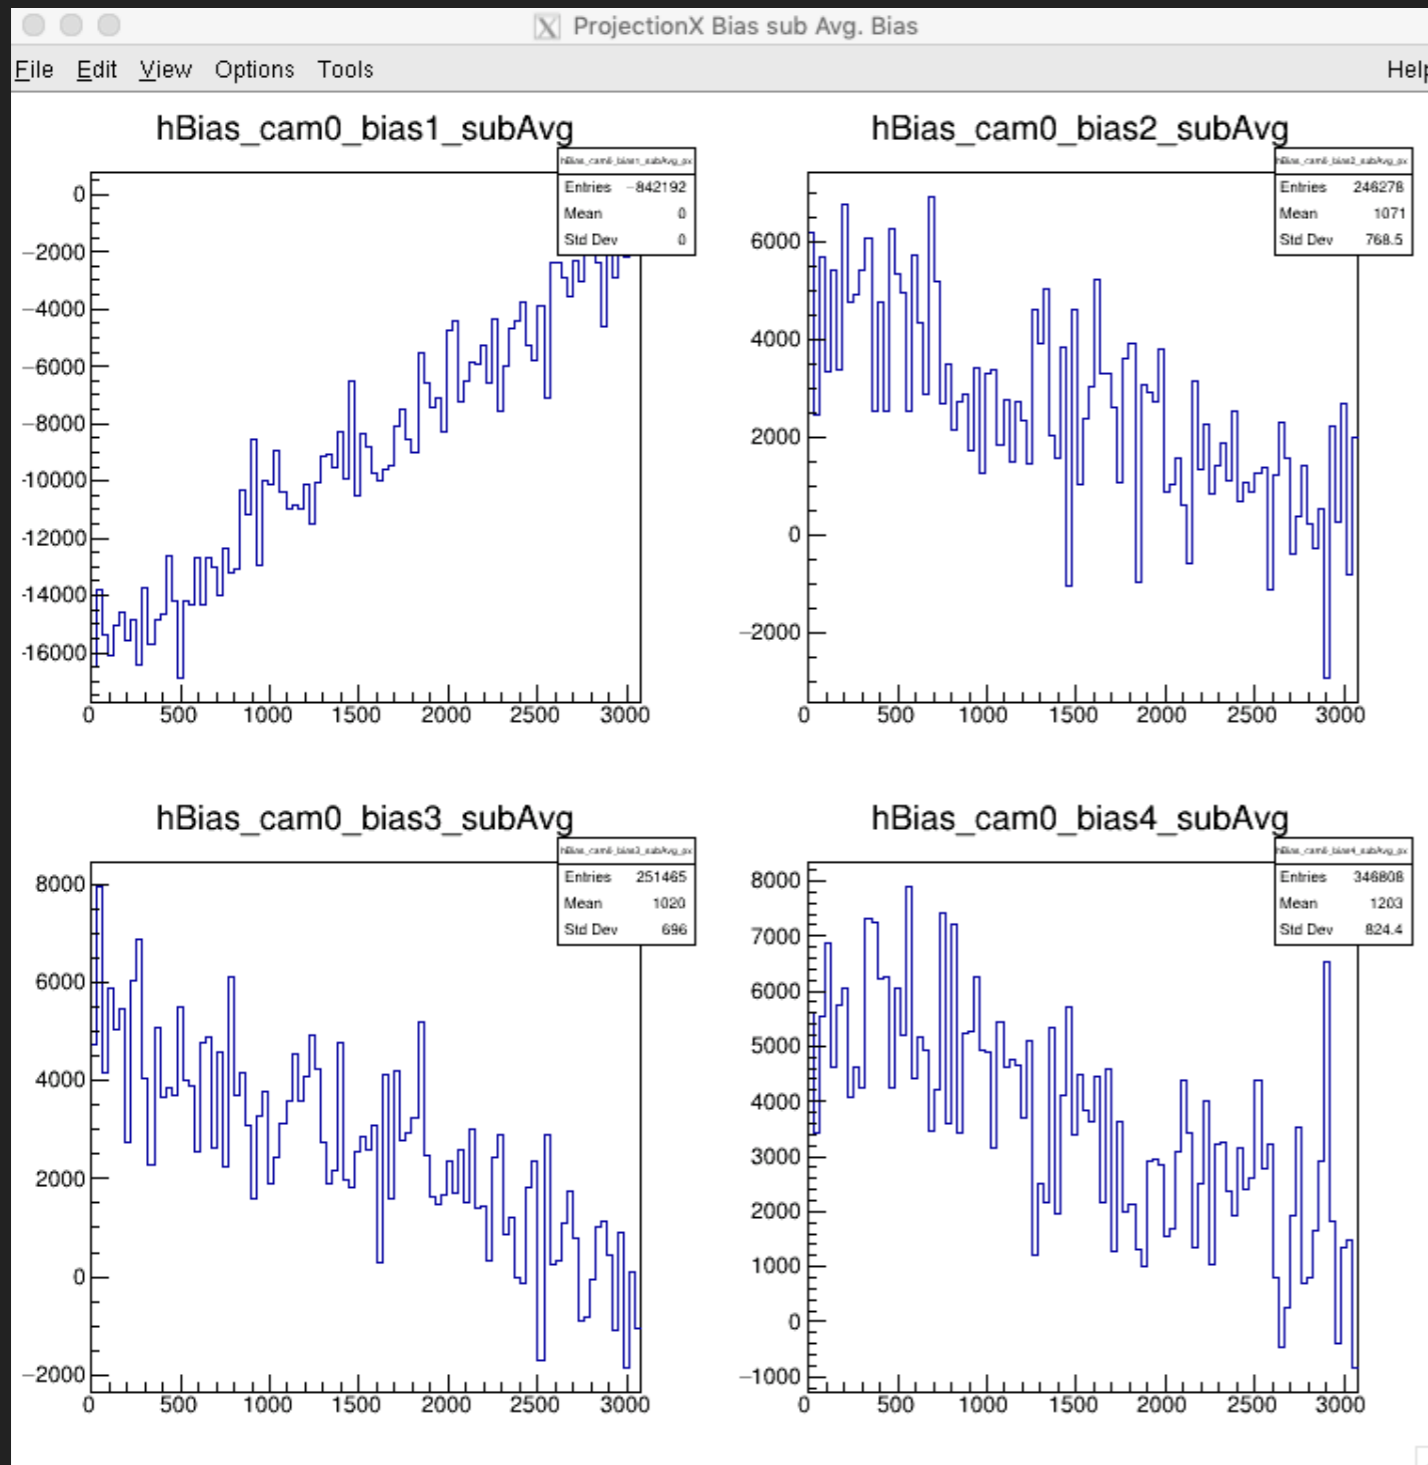

- ▶ Bias 1 has a +ve gradient while 2, 3 & 4 remain relatively flat -> this produces an avg. bias frame with a slight gradient

BIAS FRAMES: ALL 4 BIAS ~ BIAS SUB AVG BIAS: PROJECTIONX

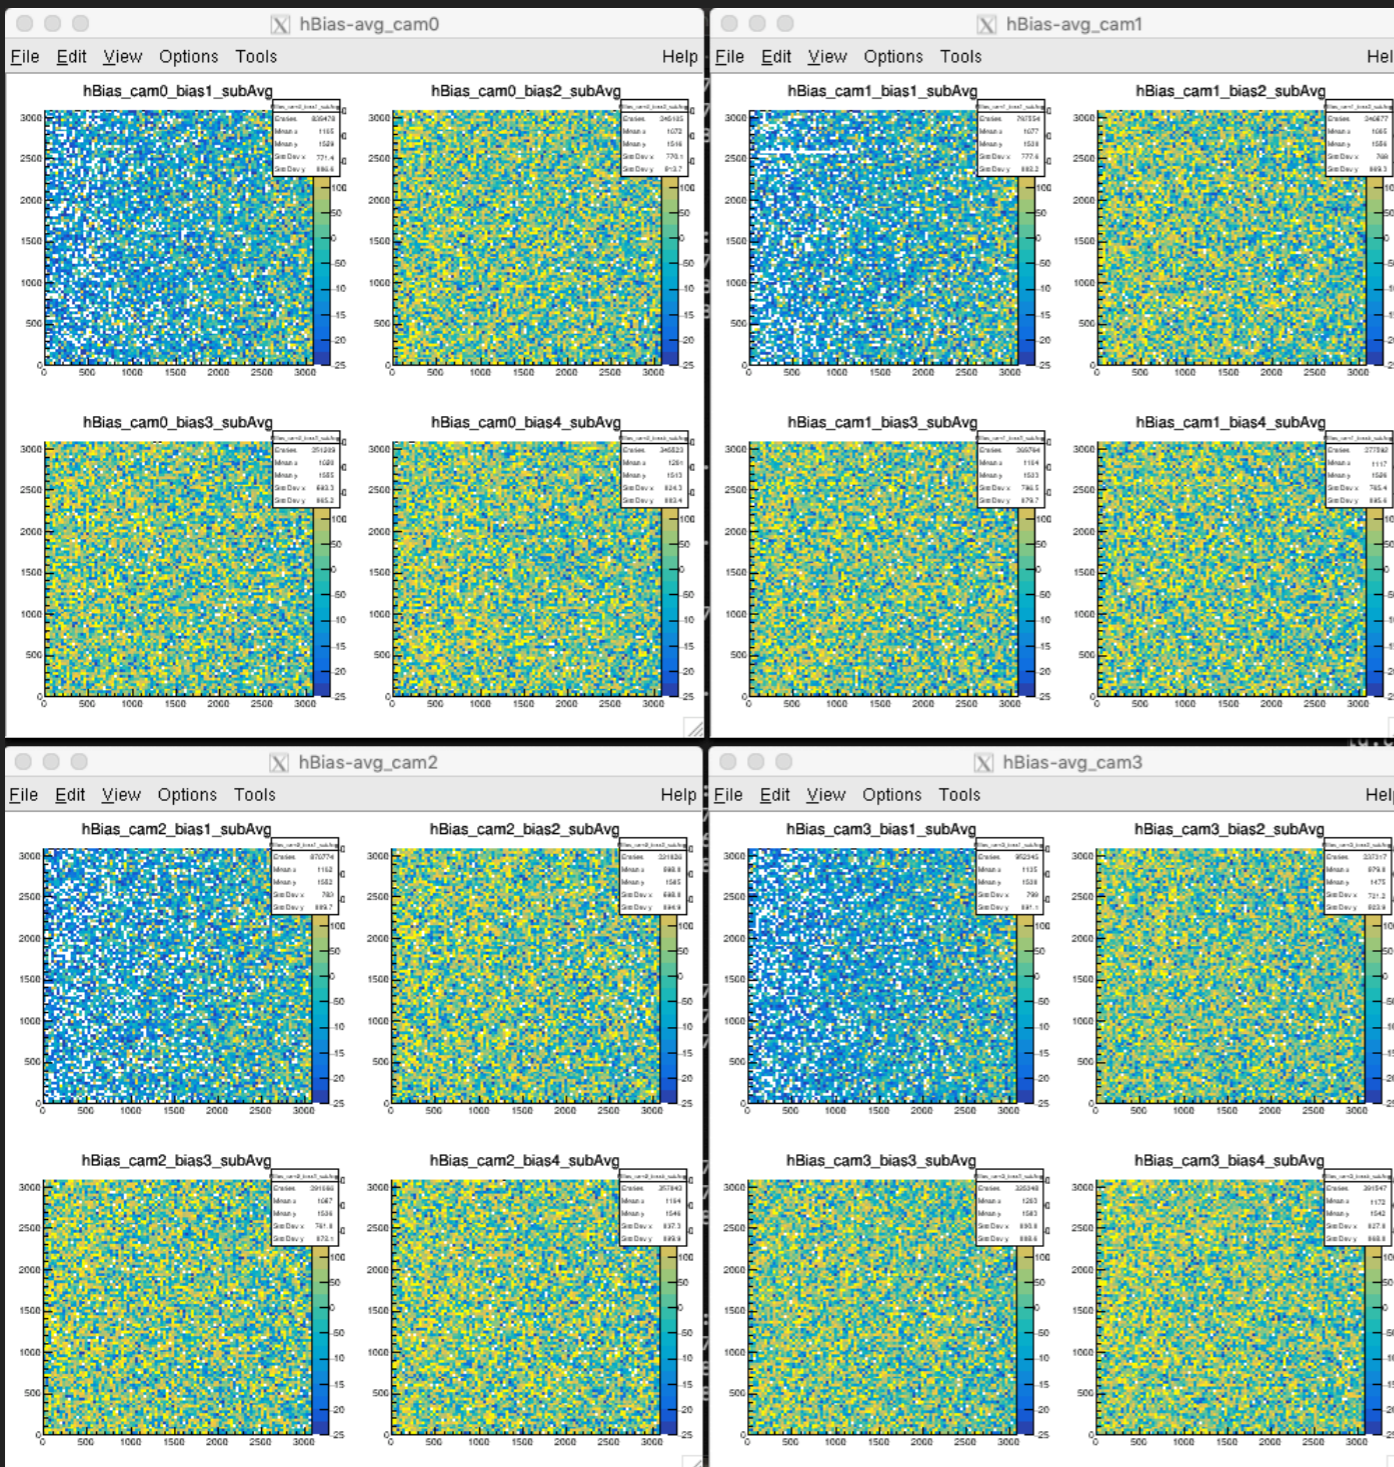

Lightsumsquareoutput_R1321037.root

- ▶ Subtracting the average bias frame from the bias frames therefore gives us a:
 - ▶ +ve gradient for Bias 1 - Avg. Bias
 - ▶ and -ve gradient for Bias 2, 3 and 4 - Avg. Bias
- ▶ This can be seen in the Projections in X and the full TH2Ds

BIAS FRAMES: ALL 4 BIAS ~ BIAS SUB AVG BIAS

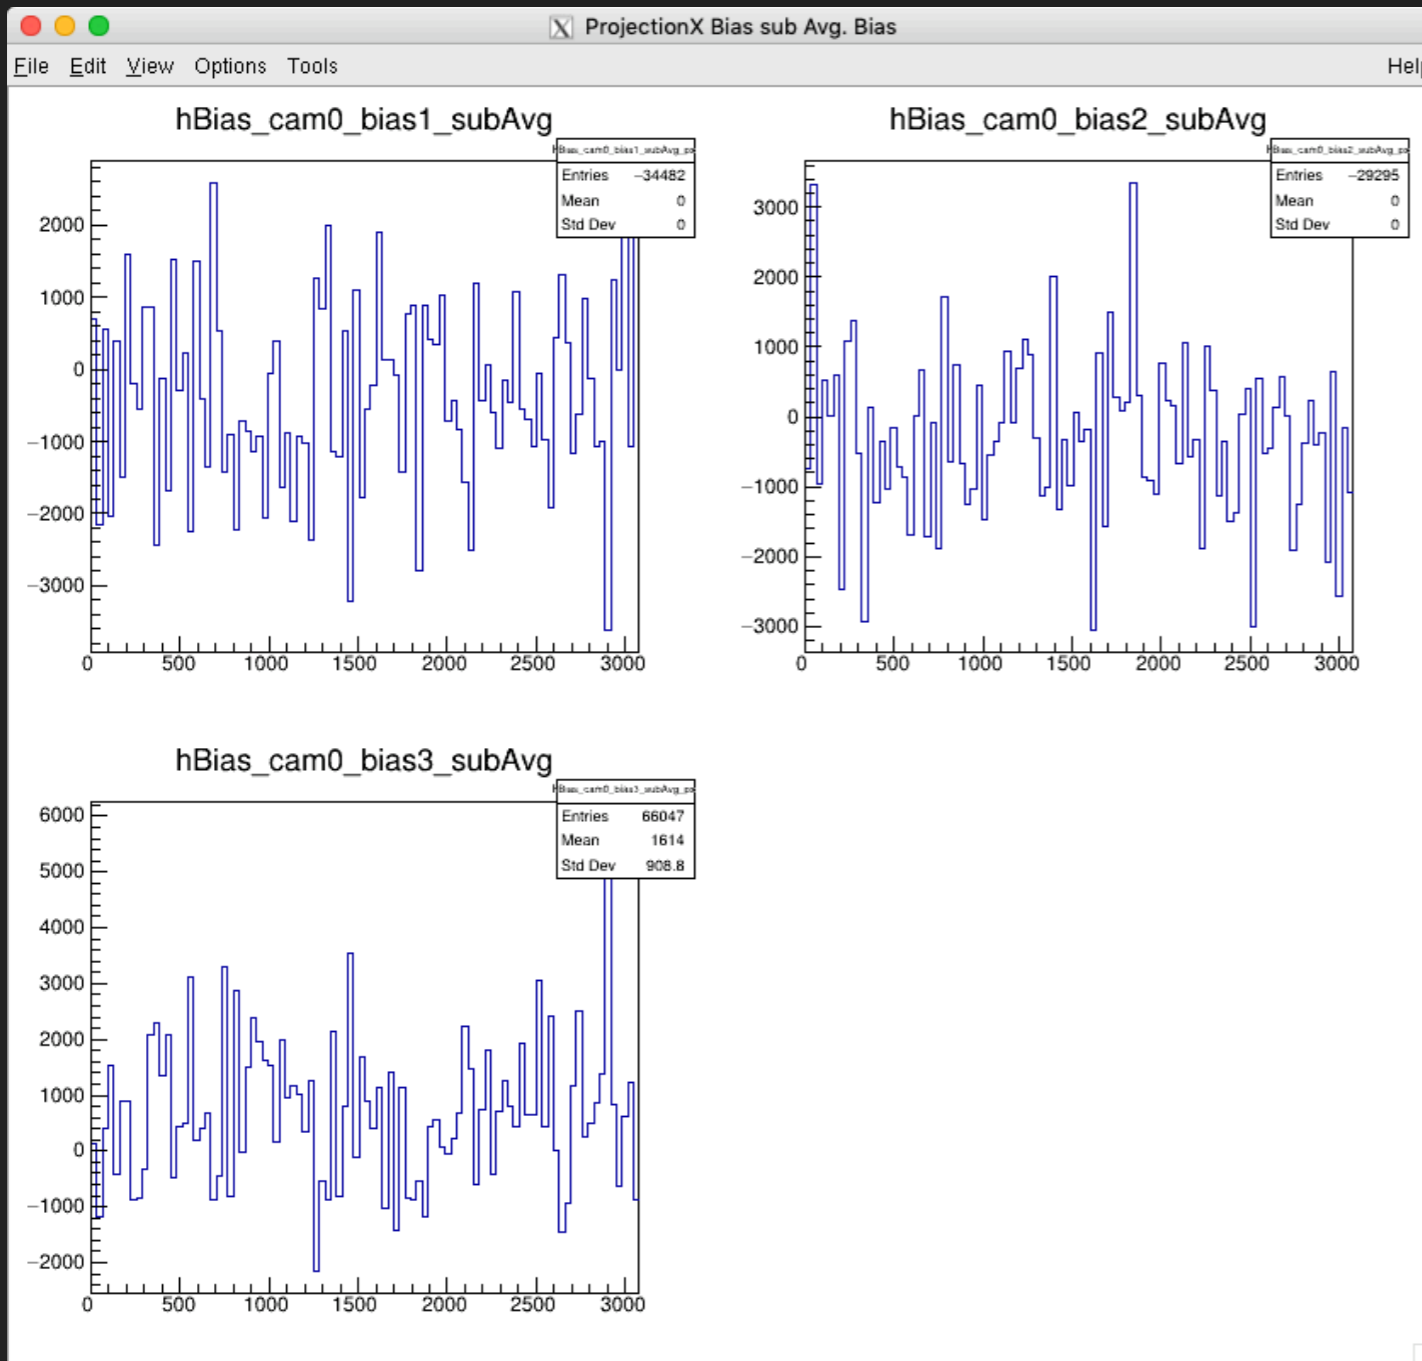

Lightsumsquareoutput_R1321037.root

- ▶ Subtracting the average bias frame from the bias frames therefore gives us a:
 - ▶ +ve gradient for Bias 1 - Avg. Bias
 - ▶ and -ve gradient for Bias 2, 3 and 4 - Avg. Bias
- ▶ This can be seen in the Projections in X and the full TH2Ds

BIAS FRAMES: LAST 3 BIAS ~ BIAS SUB AVG BIAS: PROJECTIONX

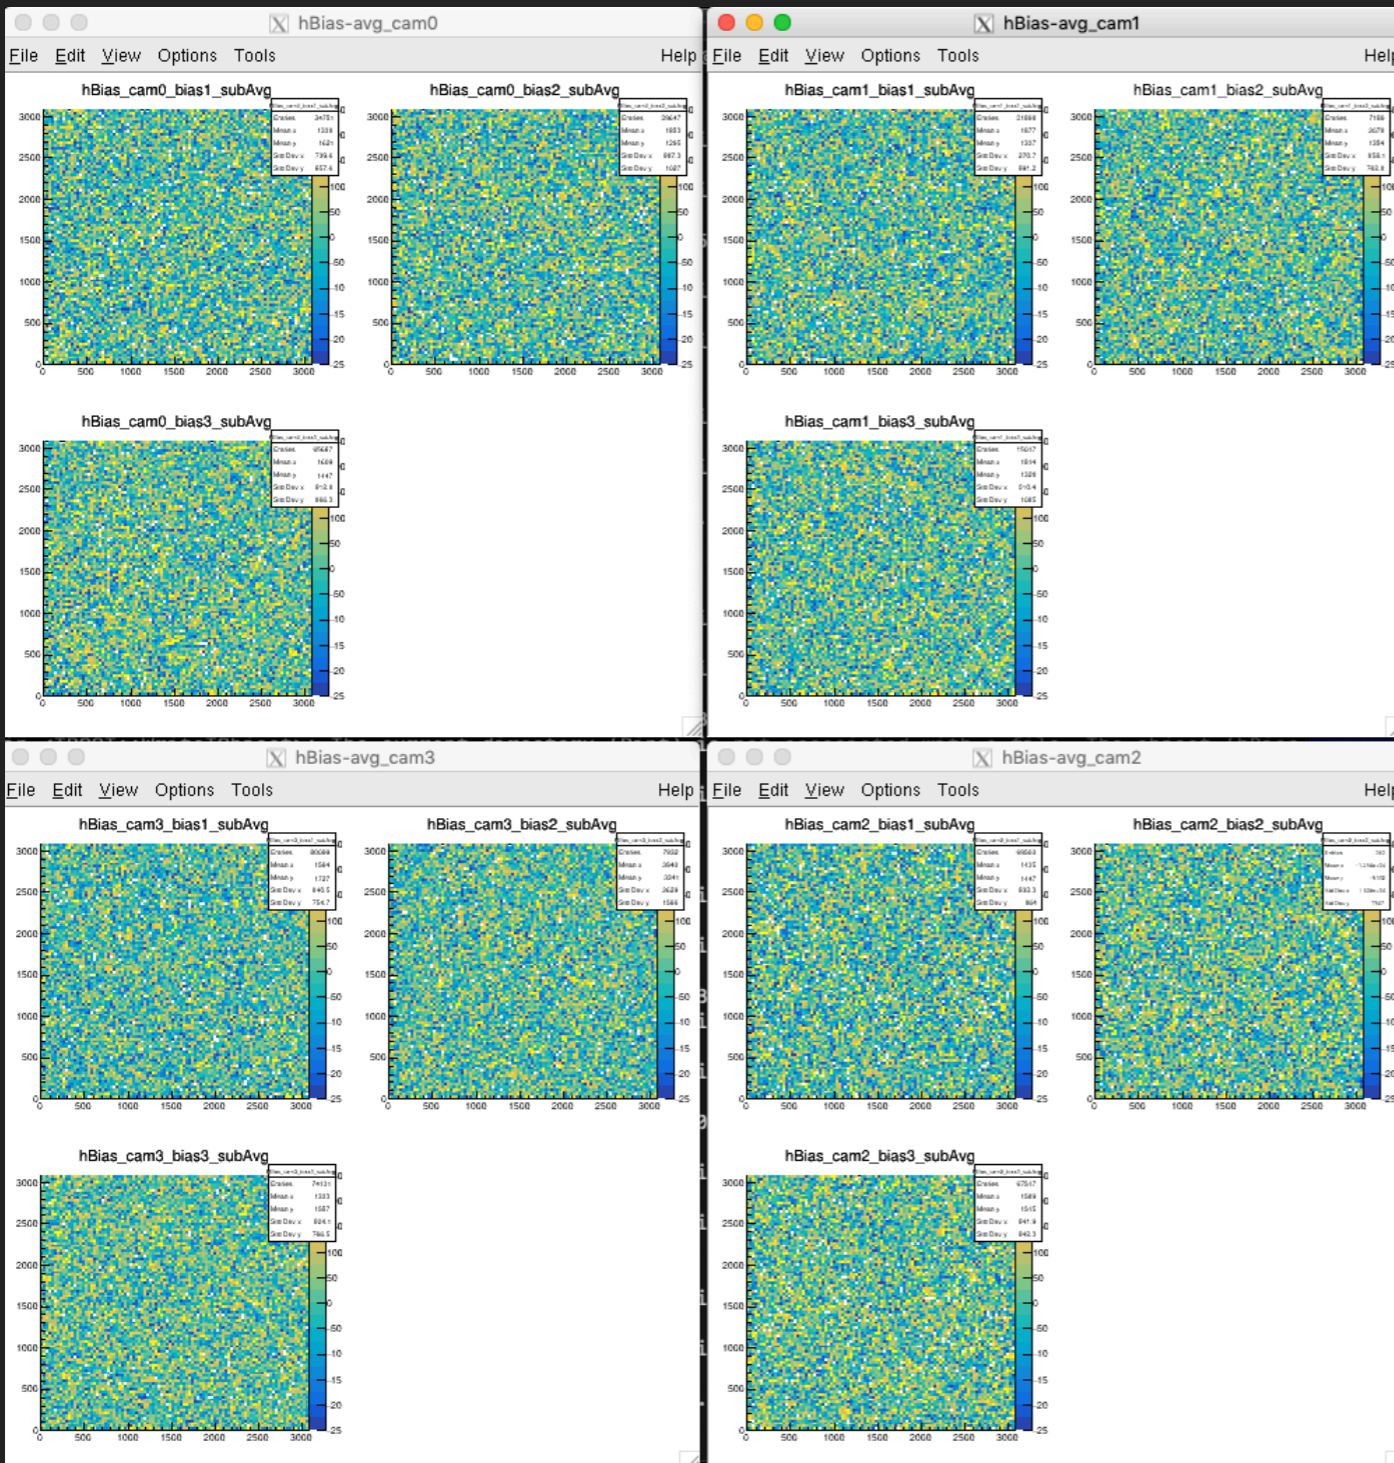

Lightsumsquareoutput_R1321037.root

- ▶ If we omit Bias 1 so that the average consists just Bias 2, 3 and 4 (now labeled 1, 2 and 3) we see comparatively flat bias - average bias in the x projections and full TH2Ds

BIAS FRAMES: LAST 3 BIAS ~ BIAS SUB AVG BIAS

Lightsumsquareoutput_R1321037.root

► If we omit Bias 1 so that the average consists just Bias 2, 3 and 4 (now labeled 1, 2 and 3) we see comparatively flat bias - average bias in the x projections and full TH2Ds

BIAS FRAMES: LAST 3 BIAS ~ BIAS SUB AVG BIAS

- ▶ For the bias - avg bias x projections we now have sensible mean Y values which sum to approx 0
- ▶ We still see some patterns w.r.t. bias number: for the mean and avg per pix we see Bias1 < Bias2 < Bias3 but this effect is order of magnitude smaller than compared to the previous run where Bias 1 was included

```

<<<<Bias Frames>>>>
<<<Camera 0>>>
Average Per Pix: 2817.61 RMS: 890.78 Mean: 1.08478e+06

<<<Camera 1>>>
Average Per Pix: 2761.04 RMS: 890.79 Mean: 1.063e+06

<<<Camera 2>>>
Average Per Pix: 2879.66 RMS: 890.757 Mean: 1.10867e+06

<<<Camera 3>>>
Average Per Pix: 3547.14 RMS: 890.766 Mean: 1.36565e+06

<<<<Bias - Avg. Bias>>>>
<<<Camera 0>>>
<bias 1>: Average Per Pix: -0.232637 RMS: 719.473 Mean: -89.5654
<bias 2>: Average Per Pix: -0.197643 RMS: 981.869 Mean: -76.0926
<bias 3>: Average Per Pix: 0.445588 RMS: 905.292 Mean: 171.552

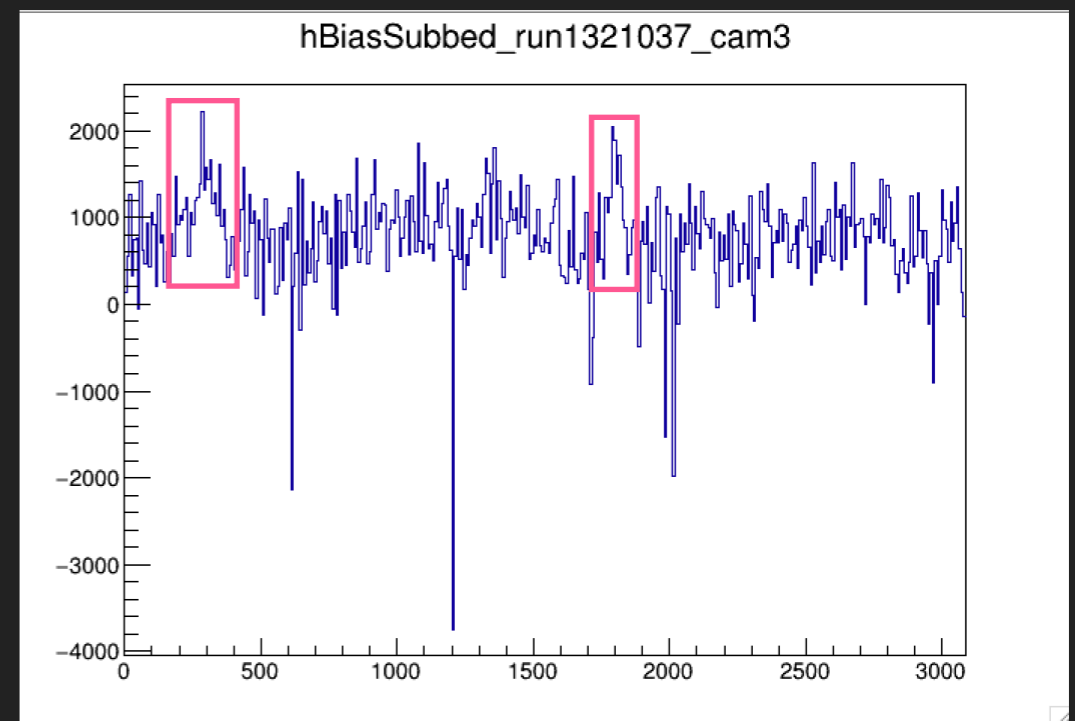

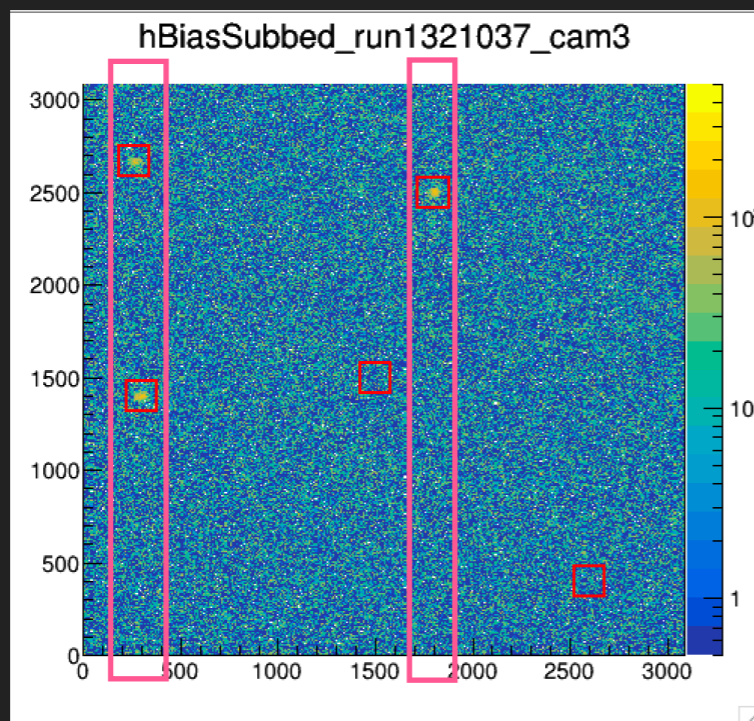

<<<Camera 1>>>
<bias 1>: Average Per Pix: -0.152181 RMS: 359.562 Mean: -58.5896
<bias 2>: Average Per Pix: 0.0412009 RMS: 831.392 Mean: 15.8623
<bias 3>: Average Per Pix: 0.113065 RMS: 306.132 Mean: 43.5299

<<<Camera 2>>>
<bias 1>: Average Per Pix: -0.462836 RMS: 939.023 Mean: -178.192
<bias 2>: Average Per Pix: 0.00427166 RMS: 18043.6 Mean: 1.64459
<bias 3>: Average Per Pix: 0.456915 RMS: 953.23 Mean: 175.912

<<<Camera 3>>>
<bias 1>: Average Per Pix: -0.543533 RMS: 836.812 Mean: -209.26
<bias 2>: Average Per Pix: 0.0632203 RMS: 2357.84 Mean: 24.3398
<bias 3>: Average Per Pix: 0.493559 RMS: 909.474 Mean: 190.02
    
```

LIGHT SUM SQUARE: PROJECTIONX OF SUMMED RUN

- ▶ This show the difference between the ProjectionX of the bias subtracted summed run before and after removing bias 1
- ▶ We can see that LightSumSquared will have a much easier time in the second case

NEXT STEPS

- ▶ Continue work on light sum square gain analysis:
 - ▶ I have rewritten LightSumSquare to run off Wills SparkKilled files from the SparkKilledApp -> This now has full functionality and runs much faster
 - ▶ Finish testing the cam index fix and bias frame changes (omitting bias 1)
 - ▶ Obtain/make SparkKilled files to run over; then
 - ▶ Rerun original analysis with the new version LightSumSquare and with the bias frame fix applied
