operators

$$m_{ij}(\tau) = m_{ij}^0 + m_{ij}^{1\alpha} \tau_\alpha + m_{ij}^{1\bar{\alpha}} \bar{\tau}_{\bar{\alpha}} + m_{ij}^{2\alpha\beta} \tau_\alpha \tau_\beta + \dots$$

vacuum alignment
in SB sector

SUSY breaking effects
RGE corrections
($\Lambda_{UV}, m_{SUSY}, \tan\beta$)

This proposal [F.F. 1706.08749]

a) neutrino masses and mixings depend on a small number of fields
[ideally a single complex field τ]

$$m_{ij}(\tau)$$

b) dependence of m_{ij} on τ is holomorphic

supersymmetric model

c) flavour symmetry acts non-linearly
[to determine all higher dimensional operators]

$$\begin{cases} \tau \rightarrow F(\tau) \\ \varphi \rightarrow G(\tau, \varphi) \end{cases} \quad \text{non-linear}$$

a) + b) + c)

the functional form of $m_{ij}(\tau)$ is completely determined

d) the VEV τ is selected by some unknown mechanism
[anarchy in vacuum selection]

Here: a) + b) + c) from **modular invariance** as flavour symmetry

Modular Invariance as Flavour Symmetry

string theory in $d=10$ need 6 compact dimensions

simplest compactification: 3 copies of a torus T^2

completely characterized by

$$\tau = \frac{\omega_2}{\omega_1} \quad \text{Im}(\tau) > 0$$

$$\mathcal{L}_{eff} = \mathcal{L}_{eff}(g(\tau), \varphi)$$

lattice left invariant by modular transformations:

$$\tau \rightarrow \gamma\tau \equiv \frac{a\tau + b}{c\tau + d}$$

a, b, c, d integers
 $ad - bc = 1$

\mathcal{L}_{eff} modular invariant

they form the (discrete, infinite) modular group $\bar{\Gamma}$ generated by

$$S: \tau \rightarrow -\frac{1}{\tau} \quad , \quad T: \tau \rightarrow \tau + 1$$

duality

discrete shift symmetry

$$S^2 = \mathbb{1} \quad , \quad (ST)^3 = \mathbb{1}$$

- can be thought of as a gauge symmetry
- with a "gauge choice" τ can be restricted to a fundamental region

most general transformation on a set of $\mathcal{N}=1$ SUSY chiral multiplets $\varphi^{(I)}$

$$\begin{cases} \tau \rightarrow \gamma\tau \equiv \frac{a\tau + b}{c\tau + d} \\ \varphi^{(I)} \rightarrow (c\tau + d)^{k_I} \rho^{(I)}(\gamma) \varphi^{(I)} \end{cases}$$

e.g.

$$\varphi^{(I)} = \begin{pmatrix} e \\ \mu \\ \tau \end{pmatrix}$$

[Ferrara, Lust, Shapere and Theisen, 1989]

the weight,
a real number

unitary representation
of the finite modular group

$$\Gamma_N \equiv \bar{\Gamma}/\bar{\Gamma}(N)$$

$$N = 1, 2, 3, \dots$$

$\mathcal{N}=1$ SUSY modular invariant theories

Yukawa interactions in $\mathcal{N}=1$ global SUSY [extension to $\mathcal{N}=1$ SUGRA straightforward]

$$S = \int d^4x d^2\theta w(\tau, \varphi) + h.c + \text{kinetic terms}$$

invariance
satisfied by
"minimal"
Kahler potential

$$w(\tau, \varphi) = \sum_n Y_{I_1 \dots I_n}(\tau) \varphi^{(I_1)} \dots \varphi^{(I_n)}$$

field-dependent
Yukawa couplings

invariance of $w(\Phi)$ guaranteed by an holomorphic $Y_{I_1 \dots I_n}(\tau)$ such that

$$Y_{I_1 \dots I_n}(\gamma\tau) = (c\tau + d)^{k_Y(n)} \rho(\gamma) Y_{I_1 \dots I_n}(\tau)$$

1. $k_Y(n) + k_{I_1} + \dots + k_{I_n} = 0$

2. $\rho \times \rho^{I_1} \times \dots \times \rho^{I_n} \supset 1$

modular forms
of level N and weight k_Y

form a linear space $\mathcal{M}_k(\Gamma_N)$
of finite dimension

Example

$$\Gamma_3 \approx A_4$$

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} \rightarrow (c\tau + d)^{-1} \rho(\gamma) \begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix}$$

$$k_\nu = -1$$

~ 3 of Γ_3

$$w(\tau, \nu) = m_0 \nu Y(\tau) \nu + h.c.$$

modular form of level 3
 $k = +2$ and $\rho \subset 3 + 1 + 1' + 1''$

$$d(\mathcal{M}_2(\Gamma_3)) = 3$$

$$\rho = 3$$

$$m(\tau) = m_0 \begin{pmatrix} 2Y_1(\tau) & -Y_3(\tau) & -Y_2(\tau) \\ -Y_3(\tau) & 2Y_2(\tau) & -Y_1(\tau) \\ -Y_2(\tau) & -Y_1(\tau) & 2Y_3(\tau) \end{pmatrix}$$

[F.F. 1706.08749]

mass matrix completely determined in terms of τ up to an overall constant

no corrections from higher order operators in the exact SUSY limit

Modular Invariance and CP

[Novichkov, Penedo, Petcov and Titov 1905.11970
see also: Baur, Nilles, Trautner and Vaudrevange,
1901.03251]

a unique CP law consistent
with the modular group
[$\text{Im}(\tau) > 0$]

$$\tau \rightarrow -\tau^*$$

[up to modular transformations]

outer automorphism of $\bar{\Gamma}$

$$S \rightarrow S \quad T \rightarrow T^{-1}$$

CP on matter multiplets

$$\varphi^{(I)} \rightarrow X_{CP} \varphi^{(I)*}$$

$X_{CP} = \mathbb{I}$ not restrictive if
S and T symmetric matrices
[canonical CP basis]

[in such a basis]
CP invariance

$$g_i^* = g_i$$

on Lagrangian parameters g_i

CP conserved \leftrightarrow τ imaginary or
at the border of the fundamental
region

otherwise CP spontaneously broken
by $\langle \tau \rangle$

Modular Forms

$k > 0$ even integer

	$d(\mathcal{M}_k(\Gamma_N))$	$k = 2$	$k = 4$	$k \geq 6$	
$\Gamma_2 \approx S_3$	$k/2 + 1$	2	1 + 2	...	[TTT]
$\Gamma_3 \approx A_4$	$k + 1$	3	1 + 1' + 3	...	[F]
$\Gamma_4 \approx S_4$	$2k + 1$	2 + 3'	1 + 2 + 3 + 3'	...	[PP]
$\Gamma_5 \approx A_5$	$5k + 1$	3 + 3' + 5	1 + 3 + 3' + 4 + 5 + 5	...	[NPPT DKL]

$$\left. \begin{array}{l} \Gamma_8 \supset \Delta(96) \\ \Gamma_{16} \supset \Delta(384) \end{array} \right\} k = 2 \quad \rho = 3$$

more solutions with IO

[P. P. Novichkov, J. T. Penedo, S. T. Petcov and A. V. Titov 1812.02158
G. J. Ding, S. F. King and X. G. Liu 1903.12588]

Some trend

most of the solutions with NO prefer a nearly degenerate spectrum $m_1 > 10 \text{ meV}$ and $|m_{ee}|$ on the high side of allowed range

[$0\nu\beta\beta$ region from: S. Dell'Oro, S. Marcocci and F. Vissani, 1404.2616]

Some trend

most of the solutions with NO prefer a nearly degenerate spectrum $m_1 > 10 \text{ meV}$ and $|m_{ee}|$ on the high side of allowed range

higher $N \rightarrow$ more solutions

any preferred value of τ ?

extrema of $V(\tau)$ at the border of the fundamental region and along the $Im(\tau)$ axis ?

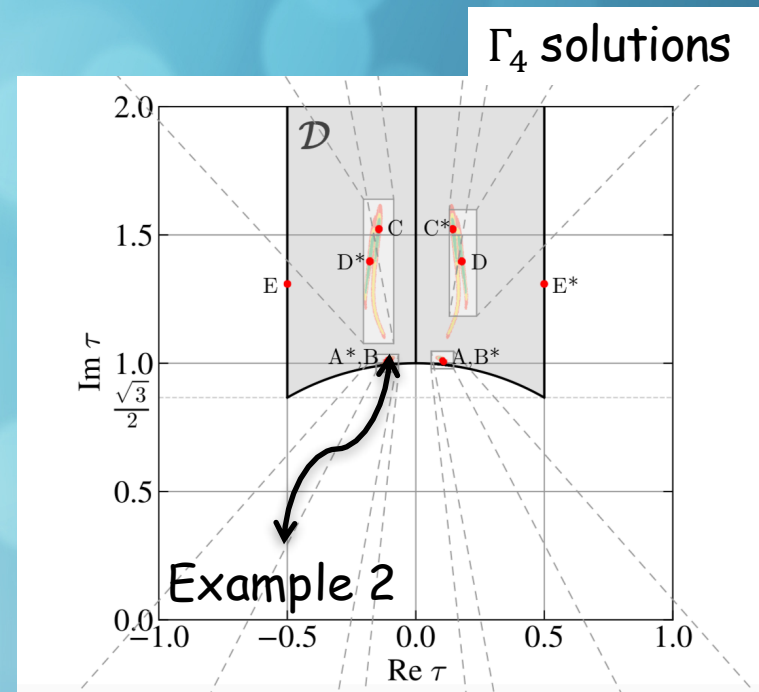

[Cvetic, Font, Ibanez, Lust and Quevedo, Nucl.Phys.B 361 (1991) 194]

[P. P. Novichkov, J. T. Penedo, S. T. Petcov and A. V. Titov, 1811.04933 and 1812.02158]

CP is conserved here

[Novichkov, Penedo, Petcov and Titov 1905.11970]

Corrections from SUSY breaking

unknown breaking mechanism. Here:

F-component of a chiral supermultiplet, gauge and modular invariant

$$X = \vartheta^2 F$$

messenger scale M

SUSY-breaking scale

$$m_{SUSY} = \frac{F}{M}$$

most general correction term to lepton masses and mixing angles

$$\delta\mathcal{S} = \frac{1}{M^2} \int d^4x d^2\theta d^2\bar{\theta} X^\dagger f(\Phi, \bar{\Phi}) + h.c.$$

$f(\Phi, \bar{\Phi})$ has dimension 3, determined by gauge invariance and lepton number conservation (treating Λ as spurion with $L=+2$)

$$\delta\mathcal{W}/\mathcal{W} \approx \delta y/y \approx \frac{m_{SUSY}}{M}$$

tiny, if sufficient gap between m_{SUSY} and M

$$10^{-10} \text{ for } \begin{matrix} m_{SUSY} = 10^8 \text{ GeV} \\ M = 10^{18} \text{ GeV} \end{matrix}$$

Conclusions

neutrino data set a new standard in model building

- accurate predictions
- falsifiable models

modular invariance as flavour symmetry can determine the functional dependence of Yukawa couplings on a modulus field

$$Y(\tau)$$

- no/less flavons,
- less parameters
- no corrections from higher dimensional operators
- stability against SUSY breaking corrections

can be implemented in a bottom-up approach:

absolute masses, m_{ee} and phases are predicted

new directions:

+ role of modular symmetry
in quark sector

[Kobayashi, Shimizu, Takagi, Tanimoto,
Tatsuishi and Uchida, 1812.11072
Okada and Tanimoto, 1812.09677]

+ in GUTs

[de Anda, King and Perdomo, 1812.05620]

+ more moduli

[de Medeiros Varzielas, King and Zhou,
1906.02208]

Modular forms of level 3 [1706.08749]

dimension of linear space $\mathcal{M}_k(\Gamma(3))$ is $(k+1)$, $k > 0$ even integer

3 linearly independent modular forms of level 3 and minimal weight $k_{\text{I}} = 2$

$$\begin{aligned} Y_1(\tau) &= \frac{i}{2\pi} \left[\frac{\eta'(\frac{\tau}{3})}{\eta(\frac{\tau}{3})} + \frac{\eta'(\frac{\tau+1}{3})}{\eta(\frac{\tau+1}{3})} + \frac{\eta'(\frac{\tau+2}{3})}{\eta(\frac{\tau+2}{3})} - \frac{27\eta'(3\tau)}{\eta(3\tau)} \right] \\ Y_2(\tau) &= \frac{-i}{\pi} \left[\frac{\eta'(\frac{\tau}{3})}{\eta(\frac{\tau}{3})} + \omega^2 \frac{\eta'(\frac{\tau+1}{3})}{\eta(\frac{\tau+1}{3})} + \omega \frac{\eta'(\frac{\tau+2}{3})}{\eta(\frac{\tau+2}{3})} \right] \\ Y_3(\tau) &= \frac{-i}{\pi} \left[\frac{\eta'(\frac{\tau}{3})}{\eta(\frac{\tau}{3})} + \omega \frac{\eta'(\frac{\tau+1}{3})}{\eta(\frac{\tau+1}{3})} + \omega^2 \frac{\eta'(\frac{\tau+2}{3})}{\eta(\frac{\tau+2}{3})} \right] . \end{aligned}$$

can be expressed in terms of the Dedekind eta function

$$\eta(\tau) = q^{1/24} \prod_{n=1}^{\infty} (1 - q^n) \quad q \equiv e^{i2\pi\tau}$$

they transform in a triplet 3 of Γ_3

$$Y(-1/\tau) = \tau^2 \rho(S)Y(\tau)$$

$$\rho(S) = \frac{1}{3} \begin{pmatrix} -1 & 2 & 2 \\ 2 & -1 & 2 \\ 2 & 2 & -1 \end{pmatrix}$$

$$Y(\tau + 1) = \rho(T)Y(\tau)$$

$$\rho(T) = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \omega & 0 \\ 0 & 0 & \omega^2 \end{pmatrix}$$

$$\omega = -\frac{1}{2} + \frac{\sqrt{3}}{2}i$$

they generate the whole ring $\mathcal{M}(\Gamma(3))$

any modular form of level 3 and weight $2k$ can be written as an homogeneous polynomial in Y_i of degree k

Corrections from RGE

Model 1 (IO)

- r and $\sin^2 \vartheta_{12}$ mostly affected, at large $\tan\beta$

$\Lambda = 10^{15} \text{ GeV}$

m_{SUSY}	Quantity	$\tan\beta = 2.5$	$\tan\beta = 10$	$\tan\beta = 15$
10^4 GeV	r	0.0302	0.0292	0.0288
	$\sin^2 \theta_{12}$	0.304	0.345	0.418
	χ_{min}^2	0.4	12.2	82.0
10^8 GeV	r	0.0302	0.0294	0.0286
	$\sin^2 \theta_{12}$	0.303	0.335	0.389
	χ_{min}^2	0.4	7.0	47.7

Model 2 (NO)

negligible corrections for $\tan\beta$ up to 25 and m_{SUSY} as low as 10^4 GeV

$\mathcal{N}=1$ SUSY modular invariant theories

known since late 1980s

S. Ferrara, D. Lust, A. D. Shapere and S. Theisen, Phys. Lett. B **225** (1989) 363.

S. Ferrara, D. Lust and S. Theisen, Phys. Lett. B **233** (1989) 147.

focus on Yukawa interactions and $\mathcal{N}=1$ global SUSY

$$\mathcal{S} = \int d^4x d^2\theta d^2\bar{\theta} K(\Phi, \bar{\Phi}) + \int d^4x d^2\theta w(\Phi) + h.c.$$

$$\Phi = (\tau, \varphi)$$

Kahler potential,
kinetic terms

superpotential, holomorphic function of Φ
Yukawa interactions

S invariant if

$$\begin{cases} w(\Phi) \rightarrow w(\Phi) \\ K(\Phi, \bar{\Phi}) \rightarrow K(\Phi, \bar{\Phi}) + f(\Phi) + f(\bar{\Phi}) \end{cases}$$

invariance of the Kahler potential easy to achieve. For example:

$$K(\Phi, \bar{\Phi}) = -h \log(-i\tau + i\bar{\tau}) + \sum_I (-i\tau + i\bar{\tau})^{-k_I} |\varphi^{(I)}|^2$$

minimal K

extension to $\mathcal{N}=1$ SUGRA straightforward: ask invariance of $G=K+\log|w|^2$

Few facts about (level-N) Modular Forms

transformation property under the modular group

$$f_i(\gamma\tau) = (c\tau + d)^k \rho(\gamma)_{ij} f_j(\tau)$$

unitary representation of the
finite modular group

$$\Gamma_N \equiv \bar{\Gamma}/\bar{\Gamma}(N)$$

q-expansion

$$f(\tau + N) = f(\tau)$$

$$f(\tau) = \sum_{i=0}^{\infty} a_n q_N^n \quad q_N = e^{\frac{i2\pi\tau}{N}}$$

$$k < 0$$

$$f(\tau) = 0$$

$$k = 0$$

$$f(\tau) = \text{constant}$$

$$k > 0 \text{ (even integer)}$$

$$f(\tau) \in \mathcal{M}_k(\Gamma(N))$$

finite-dimensional
linear space

ring of modular forms generated by few elements

$$\mathcal{M}(\Gamma(N)) = \bigoplus_{k=0}^{\infty} \mathcal{M}_{2k}(\Gamma(N))$$

an explicit example
in a moment

Level N modular forms

N	g	$d_{2k}(\Gamma(N))$	μ_N	Γ_N
2	0	$k + 1$	6	S_3
3	0	$2k + 1$	12	A_4
4	0	$4k + 1$	24	S_4
5	0	$10k + 1$	60	A_5
6	1	$12k$	72	
7	3	$28k - 2$	168	

Table 1: Some properties of modular forms: g is the genus of the space $\mathcal{H}/\Gamma(N)$ after compactification, $d_{2k}(\Gamma(N))$ the dimension of the linear space $\mathcal{M}_{2k}(\Gamma(N))$, μ_N is the dimension of the quotient group $\Gamma_N \equiv \bar{\Gamma}/\Gamma(N)$, which, for $N \leq 5$, is isomorphic to a permutation group.

Modular forms of level 3 [1706.08749]

dimension of linear space $\mathcal{M}_k(\Gamma(3))$ is $(k+1)$, $k > 0$ even integer

3 linearly independent modular forms of level 3 and minimal weight $k_{\text{I}} = 2$

$$\begin{aligned} Y_1(\tau) &= \frac{i}{2\pi} \left[\frac{\eta'(\frac{\tau}{3})}{\eta(\frac{\tau}{3})} + \frac{\eta'(\frac{\tau+1}{3})}{\eta(\frac{\tau+1}{3})} + \frac{\eta'(\frac{\tau+2}{3})}{\eta(\frac{\tau+2}{3})} - \frac{27\eta'(3\tau)}{\eta(3\tau)} \right] \\ Y_2(\tau) &= \frac{-i}{\pi} \left[\frac{\eta'(\frac{\tau}{3})}{\eta(\frac{\tau}{3})} + \omega^2 \frac{\eta'(\frac{\tau+1}{3})}{\eta(\frac{\tau+1}{3})} + \omega \frac{\eta'(\frac{\tau+2}{3})}{\eta(\frac{\tau+2}{3})} \right] \\ Y_3(\tau) &= \frac{-i}{\pi} \left[\frac{\eta'(\frac{\tau}{3})}{\eta(\frac{\tau}{3})} + \omega \frac{\eta'(\frac{\tau+1}{3})}{\eta(\frac{\tau+1}{3})} + \omega^2 \frac{\eta'(\frac{\tau+2}{3})}{\eta(\frac{\tau+2}{3})} \right] . \end{aligned}$$

can be expressed in terms of the Dedekind eta function

$$\eta(\tau) = q^{1/24} \prod_{n=1}^{\infty} (1 - q^n) \quad q \equiv e^{i2\pi\tau}$$

they transform in a triplet 3 of Γ_3

$$Y(-1/\tau) = \tau^2 \rho(S)Y(\tau)$$

$$\rho(S) = \frac{1}{3} \begin{pmatrix} -1 & 2 & 2 \\ 2 & -1 & 2 \\ 2 & 2 & -1 \end{pmatrix}$$

$$Y(\tau + 1) = \rho(T)Y(\tau)$$

$$\rho(T) = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \omega & 0 \\ 0 & 0 & \omega^2 \end{pmatrix}$$

$$\omega = -\frac{1}{2} + \frac{\sqrt{3}}{2}i$$

they generate the whole ring $\mathcal{M}(\Gamma(3))$

any modular form of level 3 and weight $2k$ can be written as an homogeneous polynomial in Y_i of degree k

Fundamental domain of $\Gamma(3)$

Figure 1: Fundamental domain for $\Gamma(3)$.

Q-expansion

$$Y_1(\tau) = 1 + 12q + 36q^2 + 12q^3 + \dots$$

$$Y_2(\tau) = -6q^{1/3}(1 + 7q + 8q^2 + \dots)$$

$$Y_3(\tau) = -18q^{2/3}(1 + 2q + 5q^2 + \dots) \quad .$$

$$Y_2^2 + 2Y_1Y_3 = 0$$

some VEVs

$$(Y_1, Y_2, Y_3)|_{\tau=i\infty} = (1, 0, 0)$$

$$(Y_1, Y_2, Y_3)|_{\tau=i} = Y_1(i)(1, 1 - \sqrt{3}, -2 + \sqrt{3})$$

$$Y(-1/\tau)|_{\tau=i} = -\rho(S)Y(\tau)|_{\tau=i}$$

Ring of level-3 modular forms

$$Y_2^2 + 2Y_1Y_3 = 0$$

As discussed explicitly in Appendix D, the constraint (30) is essential to recover the correct dimension of the linear space $\mathcal{M}_{2k}(\Gamma(3))$. On the one side from table 1 we see that this space has dimension $2k + 1$. On the other hand the number of independent homogeneous polynomial $Y_{i_1}Y_{i_2} \cdots Y_{i_k}$ of degree k that we can form with Y_i is $(k + 1)(k + 2)/2$. These polynomials are modular forms of weight $2k$ and, to match the correct dimension, $k(k - 1)/2$ among them should vanish. Indeed this happens as a consequence of eq. (30). Therefore the ring $\mathcal{M}(\Gamma(3))$ is generated by the modular forms $Y_i(\tau)$ ($i = 1, 2, 3$).

Models 1 and 2 are based on Γ_3

Why Γ_3 ? Γ_3 is isomorphic to A_4 , smallest group of the Γ_N series possessing a 3-dimensional irreducible representation
