

Parton Showers

Hard matrix element

Hard matrix element \rightarrow parton showers

Parton showers

Quarks and gluons in final state, pointlike.

Parton showers

Quarks and gluons in final state, pointlike.

- Know short distance (short time) fluctuations from matrix element/Feynman diagrams: $Q \sim \text{few GeV to } O(\text{TeV})$.
- Measure hadronic final states, long distance effects, $Q_0 \sim 1 \text{ GeV}$.

Parton showers

Quarks and gluons in final state, pointlike.

- Know short distance (short time) fluctuations from matrix element/Feynman diagrams: $Q \sim \text{few GeV to } O(\text{TeV})$.
- Parton shower evolution, multiple gluon emissions become resolvable at smaller scales. $\text{TeV} \rightarrow 1 \text{ GeV}$.
- Measure hadronic final states, long distance effects, $Q_0 \sim 1 \text{ GeV}$.

Parton showers

Quarks and gluons in final state, pointlike.

- Know short distance (short time) fluctuations from matrix element/Feynman diagrams: $Q \sim \text{few GeV to } O(\text{TeV})$.
- Parton shower evolution, multiple gluon emissions become resolvable at smaller scales. $\text{TeV} \rightarrow 1 \text{ GeV}$.
- Measure hadronic final states, long distance effects, $Q_0 \sim 1 \text{ GeV}$.

Dominated by large logs, terms

$$\alpha_S^n \log^{2n} \frac{Q}{Q_0} \sim 1 .$$

Generated from emissions *ordered* in Q .

ME approximated by parton cascade

Evolution in scale, typically $Q \sim 1 \text{ TeV}$ down to $Q \sim 1 \text{ GeV}$.

ME approximated by parton cascade

Evolution in scale, typically $Q \sim 1 \text{ TeV}$ down to $Q \sim 1 \text{ GeV}$.

e^+e^- annihilation

Good starting point: $e^+e^- \rightarrow q\bar{q}g$:

Final state momenta in one plane (orientation usually averaged).

Write momenta in terms of

$$x_i = \frac{2p_i \cdot q}{Q^2} \quad (i = 1, 2, 3),$$

$$0 \leq x_i \leq 1, x_1 + x_2 + x_3 = 2,$$

$$q = (Q, 0, 0, 0),$$

$$Q \equiv E_{cm}.$$

Fig: momentum configuration of q, \bar{q} and g for given point (x_1, x_2) , \bar{q} direction fixed.

$(x_1, x_2) = (x_q, x_{\bar{q}})$ -plane:

e^+e^- annihilation

Differential cross section:

$$\frac{d\sigma}{dx_1 dx_2} = \sigma_0 \frac{C_F \alpha_S}{2\pi} \frac{x_1^2 + x_2^2}{(1-x_1)(1-x_2)}$$

Collinear singularities: $x_1 \rightarrow 1$ or $x_2 \rightarrow 1$. Soft singularity: $x_1, x_2 \rightarrow 1$.

e^+e^- annihilation

Differential cross section:

$$\frac{d\sigma}{dx_1 dx_2} = \sigma_0 \frac{C_F \alpha_S}{2\pi} \frac{x_1^2 + x_2^2}{(1-x_1)(1-x_2)}$$

Collinear singularities: $x_1 \rightarrow 1$ or $x_2 \rightarrow 1$. Soft singularity: $x_1, x_2 \rightarrow 1$.

Rewrite in terms of x_3 and $\theta = \angle(q, g)$:

$$\frac{d\sigma}{d\cos\theta dx_3} = \sigma_0 \frac{C_F \alpha_S}{2\pi} \left[\frac{2}{\sin^2\theta} \frac{1 + (1-x_3)^2}{x_3} - x_3 \right]$$

Singular as $\theta \rightarrow 0$ and $x_3 \rightarrow 0$.

e^+e^- annihilation

Can separate into two jets as

$$\begin{aligned}\frac{2d\cos\theta}{\sin^2\theta} &= \frac{d\cos\theta}{1-\cos\theta} + \frac{d\cos\theta}{1+\cos\theta} \\ &= \frac{d\cos\theta}{1-\cos\theta} + \frac{d\cos\bar{\theta}}{1-\cos\bar{\theta}} \\ &\approx \frac{d\theta^2}{\theta^2} + \frac{d\bar{\theta}^2}{\bar{\theta}^2}\end{aligned}$$

e^+e^- annihilation

Can separate into two jets as

$$\begin{aligned}\frac{2d\cos\theta}{\sin^2\theta} &= \frac{d\cos\theta}{1-\cos\theta} + \frac{d\cos\theta}{1+\cos\theta} \\ &= \frac{d\cos\theta}{1-\cos\theta} + \frac{d\cos\bar{\theta}}{1-\cos\bar{\theta}} \\ &\approx \frac{d\theta^2}{\theta^2} + \frac{d\bar{\theta}^2}{\bar{\theta}^2}\end{aligned}$$

So, we rewrite $d\sigma$ in collinear limit as

$$d\sigma = \sigma_0 \sum_{\text{jets}} \frac{d\theta^2}{\theta^2} \frac{\alpha_S}{2\pi} C_F \frac{1+(1-z)^2}{z} dz$$

e^+e^- annihilation

Can separate into two jets as

$$\begin{aligned}\frac{2d\cos\theta}{\sin^2\theta} &= \frac{d\cos\theta}{1-\cos\theta} + \frac{d\cos\theta}{1+\cos\theta} \\ &= \frac{d\cos\theta}{1-\cos\theta} + \frac{d\cos\bar{\theta}}{1-\cos\bar{\theta}} \\ &\approx \frac{d\theta^2}{\theta^2} + \frac{d\bar{\theta}^2}{\bar{\theta}^2}\end{aligned}$$

So, we rewrite $d\sigma$ in collinear limit as

$$\begin{aligned}d\sigma &= \sigma_0 \sum_{\text{jets}} \frac{d\theta^2}{\theta^2} \frac{\alpha_S}{2\pi} C_F \frac{1+(1-z)^2}{z} dz \\ &= \sigma_0 \sum_{\text{jets}} \frac{d\theta^2}{\theta^2} \frac{\alpha_S}{2\pi} P(z) dz\end{aligned}$$

with DGLAP splitting function $P(z)$.

Collinear limit

Universal DGLAP splitting kernels for collinear limit:

$$d\sigma = \sigma_0 \sum_{\text{jets}} \frac{d\theta^2}{\theta^2} \frac{\alpha_s}{2\pi} P(z) dz$$

$$P_{q \rightarrow qg}(z) = C_F \frac{1+z^2}{1-z}$$

$$P_{g \rightarrow gg}(z) = C_A \frac{(1-z(1-z))^2}{z(1-z)}$$

$$P_{q \rightarrow gq}(z) = C_F \frac{1+(1-z)^2}{z}$$

$$P_{g \rightarrow qq}(z) = T_R(1-2z(1-z))$$

Collinear limit

Universal DGLAP splitting kernels for collinear limit:

$$d\sigma = \sigma_0 \sum_{\text{jets}} \frac{d\theta^2}{\theta^2} \frac{\alpha_s}{2\pi} P(z) dz$$

Note: Other variables may equally well characterize the collinear limit:

$$\frac{d\theta^2}{\theta^2} \sim \frac{dQ^2}{Q^2} \sim \frac{dp_{\perp}^2}{p_{\perp}^2} \sim \frac{d\tilde{q}^2}{\tilde{q}^2} \sim \frac{dt}{t}$$

whenever $Q^2, p_{\perp}^2, t \rightarrow 0$ means “collinear”.

Collinear limit

Universal DGLAP splitting kernels for collinear limit:

$$d\sigma = \sigma_0 \sum_{\text{jets}} \frac{d\theta^2}{\theta^2} \frac{\alpha_s}{2\pi} P(z) dz$$

Note: Other variables may equally well characterize the collinear limit:

$$\frac{d\theta^2}{\theta^2} \sim \frac{dQ^2}{Q^2} \sim \frac{dp_{\perp}^2}{p_{\perp}^2} \sim \frac{d\tilde{q}^2}{\tilde{q}^2} \sim \frac{dt}{t}$$

whenever $Q^2, p_{\perp}^2, t \rightarrow 0$ means “collinear”.

- θ : HERWIG
- Q^2 : PYTHIA ≤ 6.3 , SHERPA.
- p_{\perp} : PYTHIA ≥ 6.4 , ARIADNE, Catani–Seymour showers.
- \tilde{q} : Herwig++.

Resolution

Need to introduce **resolution** t_0 , e.g. a cutoff in p_{\perp} . Prevent us from the singularity at $\theta \rightarrow 0$.

Emissions below t_0 are **unresolvable**.

Finite result due to virtual corrections:

The diagram shows two Feynman diagrams representing different types of corrections. The first diagram on the left shows a horizontal black line with a red wavy line (representing a gluon emission) attached to it. The second diagram on the right shows a horizontal black line with a red wavy line loop (representing a virtual gluon correction) attached to it. A plus sign is between the two diagrams, and an equals sign followed by the word "finite." is to the right of the second diagram.

unresolvable + virtual emissions are included in Sudakov form factor via unitarity (see below!).

Towards multiple emissions

Starting point: factorisation in collinear limit, single emission.

$$\sigma_{2+1}(t_0) = \sigma_2(t_0) \int_{t_0}^t \frac{dt'}{t'} \int_{z_-}^{z_+} dz \frac{\alpha_S}{2\pi} \hat{P}(z) = \sigma_2(t_0) \int_{t_0}^t dt W(t) .$$

Towards multiple emissions

Starting point: factorisation in collinear limit, single emission.

$$\sigma_{2+1}(t_0) = \sigma_2(t_0) \int_{t_0}^t \frac{dt'}{t'} \int_{z_-}^{z_+} dz \frac{\alpha_S}{2\pi} \hat{P}(z) = \sigma_2(t_0) \int_{t_0}^t dt W(t) .$$

Simple example:

Multiple photon emissions, strongly ordered in t .

We want

$$W_{\text{sum}} = \sum_{n=1} W_{2+n} = \frac{\int \left| \begin{array}{c} \nearrow \\ \bullet \\ \searrow \\ \text{---} \\ \nearrow \end{array} \right|^2 d\Phi_1 + \int \left| \begin{array}{c} \nearrow \\ \bullet \\ \searrow \\ \text{---} \\ \nearrow \\ \text{---} \\ \nearrow \end{array} \right|^2 d\Phi_2 + \int \left| \begin{array}{c} \nearrow \\ \bullet \\ \searrow \\ \text{---} \\ \nearrow \\ \text{---} \\ \nearrow \\ \text{---} \\ \nearrow \end{array} \right|^2 d\Phi_3 + \dots}{\left| \begin{array}{c} \nearrow \\ \bullet \\ \searrow \end{array} \right|^2}$$

for any number of emissions.

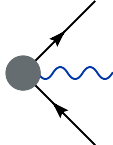

Towards multiple emissions

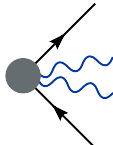

$$W_{2+1} = \left(\int \left| \begin{array}{c} \text{diagram 1} \\ \text{diagram 2} \end{array} \right|^2 + \left| \begin{array}{c} \text{diagram 3} \\ \text{diagram 4} \end{array} \right|^2 d\Phi_1 \right) / \left| \begin{array}{c} \text{diagram 5} \\ \text{diagram 6} \end{array} \right|^2 = \frac{2}{1!} \int_{t_0}^t dt W(t) .$$

The equation defines the transition rate W_{2+1} for a process with two outgoing particles and one photon. The numerator is the integral of the squared magnitudes of two diagrams (representing different emission orders) over the phase space $d\Phi_1$. The denominator is the squared magnitude of the tree-level diagram. The result is shown to be $2 \int_{t_0}^t dt W(t)$.

Towards multiple emissions

$(n = 1)$ 

$$W_{2+1} = \left(\int \left| \begin{array}{c} \text{diagram 1} \\ \text{diagram 2} \end{array} \right|^2 + \left| \begin{array}{c} \text{diagram 3} \\ \text{diagram 4} \end{array} \right|^2 d\Phi_1 \right) / \left| \begin{array}{c} \text{diagram 5} \\ \text{diagram 6} \end{array} \right|^2 = \frac{2}{1!} \int_{t_0}^t dt W(t).$$

$(n = 2)$ 

$$W_{2+2} = \left(\int \left| \begin{array}{c} \text{diagram 1} \\ \text{diagram 2} \end{array} \right|^2 + \left| \begin{array}{c} \text{diagram 3} \\ \text{diagram 4} \end{array} \right|^2 + \left| \begin{array}{c} \text{diagram 5} \\ \text{diagram 6} \end{array} \right|^2 + \left| \begin{array}{c} \text{diagram 7} \\ \text{diagram 8} \end{array} \right|^2 d\Phi_2 \right) / \left| \begin{array}{c} \text{diagram 9} \\ \text{diagram 10} \end{array} \right|^2$$

$$= 2^2 \int_{t_0}^t dt' \int_{t_0}^{t'} dt'' W(t') W(t'') = \frac{2^2}{2!} \left(\int_{t_0}^t dt W(t) \right)^2.$$

We used

$$\int_{t_0}^t dt_1 \dots \int_{t_0}^{t_{n-1}} dt_n W(t_1) \dots W(t_n) = \frac{1}{n!} \left(\int_{t_0}^t dt W(t) \right)^n.$$

Towards multiple emissions

Easily generalized to n emissions  by induction. *i.e.*

$$W_{2+n} = \frac{2^n}{n!} \left(\int_{t_0}^t dt W(t) \right)^n$$

Towards multiple emissions

Easily generalized to n emissions  ... by induction. *i.e.*

$$W_{2+n} = \frac{2^n}{n!} \left(\int_{t_0}^t dt W(t) \right)^n$$

So, in total we get

$$\sigma_{>2}(t_0) = \sigma_2(t_0) \sum_{k=1}^{\infty} \frac{2^k}{k!} \left(\int_{t_0}^t dt W(t) \right)^k = \sigma_2(t_0) \left(e^{2 \int_{t_0}^t dt W(t)} - 1 \right)$$

Towards multiple emissions

Easily generalized to n emissions  ... by induction. *i.e.*

$$W_{2+n} = \frac{2^n}{n!} \left(\int_{t_0}^t dt W(t) \right)^n$$

So, in total we get

$$\begin{aligned} \sigma_{>2}(t_0) &= \sigma_2(t_0) \sum_{k=1}^{\infty} \frac{2^k}{k!} \left(\int_{t_0}^t dt W(t) \right)^k = \sigma_2(t_0) \left(e^{2 \int_{t_0}^t dt W(t)} - 1 \right) \\ &= \sigma_2(t_0) \left(\frac{1}{\Delta^2(t_0, t)} - 1 \right) \end{aligned}$$

Sudakov Form Factor

$$\Delta(t_0, t) = \exp \left[- \int_{t_0}^t dt W(t) \right]$$

Towards multiple emissions

Easily generalized to n emissions  by induction. *i.e.*

$$W_{2+n} = \frac{2^n}{n!} \left(\int_{t_0}^t dt W(t) \right)^n$$

So, in total we get

$$\begin{aligned} \sigma_{>2}(t_0) &= \sigma_2(t_0) \sum_{k=1}^{\infty} \frac{2^k}{k!} \left(\int_{t_0}^t dt W(t) \right)^k = \sigma_2(t_0) \left(e^{2 \int_{t_0}^t dt W(t)} - 1 \right) \\ &= \sigma_2(t_0) \left(\frac{1}{\Delta^2(t_0, t)} - 1 \right) \end{aligned}$$

Sudakov Form Factor in QCD

$$\Delta(t_0, t) = \exp \left[- \int_{t_0}^t dt W(t) \right] = \exp \left[- \int_{t_0}^t \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz \right]$$

Sudakov form factor

Note that

$$\begin{aligned}\sigma_{\text{all}} &= \sigma_2 + \sigma_{>2} = \sigma_2 + \sigma_2 \left(\frac{1}{\Delta^2(t_0, t)} - 1 \right), \\ \Rightarrow \Delta^2(t_0, t) &= \frac{\sigma_2}{\sigma_{\text{all}}}.\end{aligned}$$

Two jet rate = $\Delta^2 = P^2$ (No emission in the range $t \rightarrow t_0$).

Sudakov form factor = No emission probability .

Often $\Delta(t_0, t) \equiv \Delta(t)$.

- Hard scale t , typically CM energy or p_{\perp} of hard process.
- Resolution t_0 , two partons are resolved as two entities if inv mass or relative p_{\perp} above t_0 .
- P^2 (not P), as we have two legs that evolve independently.

Sudakov form factor from Markov property

Unitarity

$$\begin{aligned} P(\text{"some emission"}) + P(\text{"no emission"}) \\ = P(0 < t \leq T) + \bar{P}(0 < t \leq T) = 1. \end{aligned}$$

Multiplication law (no memory)

$$\bar{P}(0 < t \leq T) = \bar{P}(0 < t \leq t_1) \bar{P}(t_1 < t \leq T)$$

Sudakov form factor from Markov property

Unitarity

$$\begin{aligned} P(\text{"some emission"}) + P(\text{"no emission"}) \\ = P(0 < t \leq T) + \bar{P}(0 < t \leq T) = 1. \end{aligned}$$

Multiplication law (no memory)

$$\bar{P}(0 < t \leq T) = \bar{P}(0 < t \leq t_1) \bar{P}(t_1 < t \leq T)$$

Then subdivide into n pieces: $t_i = \frac{i}{n}T, 0 \leq i \leq n$.

$$\begin{aligned} \bar{P}(0 < t \leq T) &= \lim_{n \rightarrow \infty} \prod_{i=0}^{n-1} \bar{P}(t_i < t \leq t_{i+1}) = \lim_{n \rightarrow \infty} \prod_{i=0}^{n-1} (1 - P(t_i < t \leq t_{i+1})) \\ &= \exp \left(- \lim_{n \rightarrow \infty} \sum_{i=0}^{n-1} P(t_i < t \leq t_{i+1}) \right) = \exp \left(- \int_0^T \frac{dP(t)}{dt} dt \right). \end{aligned}$$

Sudakov form factor

Again, no-emission probability!

$$\bar{P}(0 < t \leq T) = \exp\left(-\int_0^T \frac{dP(t)}{dt} dt\right)$$

So,

$$\begin{aligned} dP(\text{first emission at } T) &= dP(T) \bar{P}(0 < t \leq T) \\ &= dP(T) \exp\left(-\int_0^T \frac{dP(t)}{dt} dt\right) \end{aligned}$$

That's what we need for our parton shower! Probability density for next emission at t :

$$dP(\text{next emission at } t) = \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz \exp\left[-\int_{t_0}^t \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz\right]$$

Parton shower Monte Carlo

Probability density:

$$dP(\text{next emission at } t) = \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz \exp \left[- \int_{t_0}^t \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz \right]$$

Conveniently, the probability distribution is $\Delta(t)$ itself.

Parton shower Monte Carlo

Probability density:

$$dP(\text{next emission at } t) = \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz \exp \left[- \int_{t_0}^t \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz \right]$$

Conveniently, the probability distribution is $\Delta(t)$ itself.

Hence, parton shower very roughly from (HERWIG):

- ① Choose flat random number $0 \leq \rho \leq 1$.
- ② If $\rho < \Delta(t_{\max})$: no resolvable emission, stop this branch.
- ③ Else solve $\rho = \Delta(t_{\max})/\Delta(t)$
(= no emission between t_{\max} and t) for t .
Reset $t_{\max} = t$ and goto 1.

Determine z essentially according to integrand in front of exp.

Parton shower Monte Carlo

Probability density:

$$dP(\text{next emission at } t) = \frac{dt}{t} \int_{z_-}^{z_+} \frac{\alpha_S(z, t)}{2\pi} \hat{P}(z, t) dz \exp \left[- \int_{t_0}^t \frac{dt'}{t'} \int_{z_-}^{z_+} \frac{\alpha_S(z, t')}{2\pi} \hat{P}(z, t') dz \right]$$

Conveniently, the probability distribution is $\Delta(t)$ itself.

- That was old HERWIG variant. Relies on (numerical) integration/tabulation for $\Delta(t)$.
- Pythia, now also Herwig++, use the **Veto Algorithm**.
- Method to sample x from distribution of the type

$$dP = F(x) \exp \left[- \int^x dx' F(x') \right] dx .$$

Simpler, more flexible, but slightly slower.

Parton cascade

Get tree structure, ordered in evolution variable t :

Here: $t_1 > t_2 > t_3; t_2 > t_{3'}$ etc.

Construct four momenta from (t_i, z_i) and (random) azimuth ϕ .

Parton cascade

Get tree structure, ordered in evolution variable t :

Here: $t_1 > t_2 > t_3; t_2 > t_{3'}$ etc.

Construct four momenta from (t_i, z_i) and (random) azimuth ϕ .

Not at all unique!

Many (more or less clever) choices still to be made.

Parton cascade

Get tree structure, ordered in evolution variable t :

- t can be $\theta, Q^2, p_{\perp}, \dots$
- Choice of hard scale t_{\max} not fixed. “Some hard scale”.
- z can be light cone momentum fraction, energy fraction, \dots
- Available parton shower phase space.
- Integration limits.
- Regularisation of soft singularities.
- \dots

Good choices needed here to describe wealth of data!

Soft emissions

- Only *collinear* emissions so far.
- Including *collinear+soft*.
- *Large angle+soft* also important.

Soft emissions

- Only *collinear* emissions so far.
- Including *collinear+soft*.
- *Large angle+soft* also important.

Soft emission: consider *eikonal factors*,
here for $q(p+q) \rightarrow q(p)g(q)$, soft g :

$$u(p) \not{\epsilon} \frac{\not{p} + \not{q} + m}{(p+q)^2 - m^2} \longrightarrow u(p) \frac{p \cdot \epsilon}{p \cdot q}$$

soft factorisation. Universal, *i.e.* independent of emitter.

In general:

$$d\sigma_{n+1} = d\sigma_n \frac{d\omega}{\omega} \frac{d\Omega}{2\pi} \frac{\alpha_S}{2\pi} \sum_{ij} C_{ij} W_{ij} \quad (\text{“QCD–Antenna”})$$

with

$$W_{ij} = \frac{1 - \cos \theta_{ij}}{(1 - \cos \theta_{iq})(1 - \cos \theta_{qj})} .$$

Soft emissions

We define

$$W_{ij} = \frac{1 - \cos \theta_{ij}}{(1 - \cos \theta_{iq})(1 - \cos \theta_{qj})} \equiv W_{ij}^{(i)} + W_{ij}^{(j)}$$

with

$$W_{ij}^{(i)} = \frac{1}{2} \left(W_{ij} + \frac{1}{1 - \cos \theta_{iq}} - \frac{1}{1 - \cos \theta_{qj}} \right).$$

$W_{ij}^{(i)}$ is only collinear divergent if $q \parallel i$ etc .

Soft emissions

We define

$$W_{ij} = \frac{1 - \cos \theta_{ij}}{(1 - \cos \theta_{iq})(1 - \cos \theta_{qj})} \equiv W_{ij}^{(i)} + W_{ij}^{(j)}$$

with

$$W_{ij}^{(i)} = \frac{1}{2} \left(W_{ij} + \frac{1}{1 - \cos \theta_{iq}} - \frac{1}{1 - \cos \theta_{qj}} \right).$$

$W_{ij}^{(i)}$ is only collinear divergent if $q \parallel i$ etc .

After integrating out the azimuthal angles, we find

$$\int \frac{d\phi_{iq}}{2\pi} W_{ij}^{(i)} = \begin{cases} \frac{1}{1 - \cos \theta_{iq}} & (\theta_{iq} < \theta_{ij}) \\ 0 & \text{otherwise} \end{cases}$$

That's angular ordering.

Angular ordering

Radiation from parton i is bound to a cone, given by the colour partner parton j .

Results in angular ordered parton shower and suppresses soft gluons viz. hadrons in a jet.

Colour coherence from CDF

Events with 2 hard (> 100 GeV) jets and a soft 3rd jet (~ 10 GeV)

FIG. 14. Observed R distribution compared to the predictions of (a) HERWIG; (b) ISAJET; (c) PYTHIA; (d) PYTHIA+.

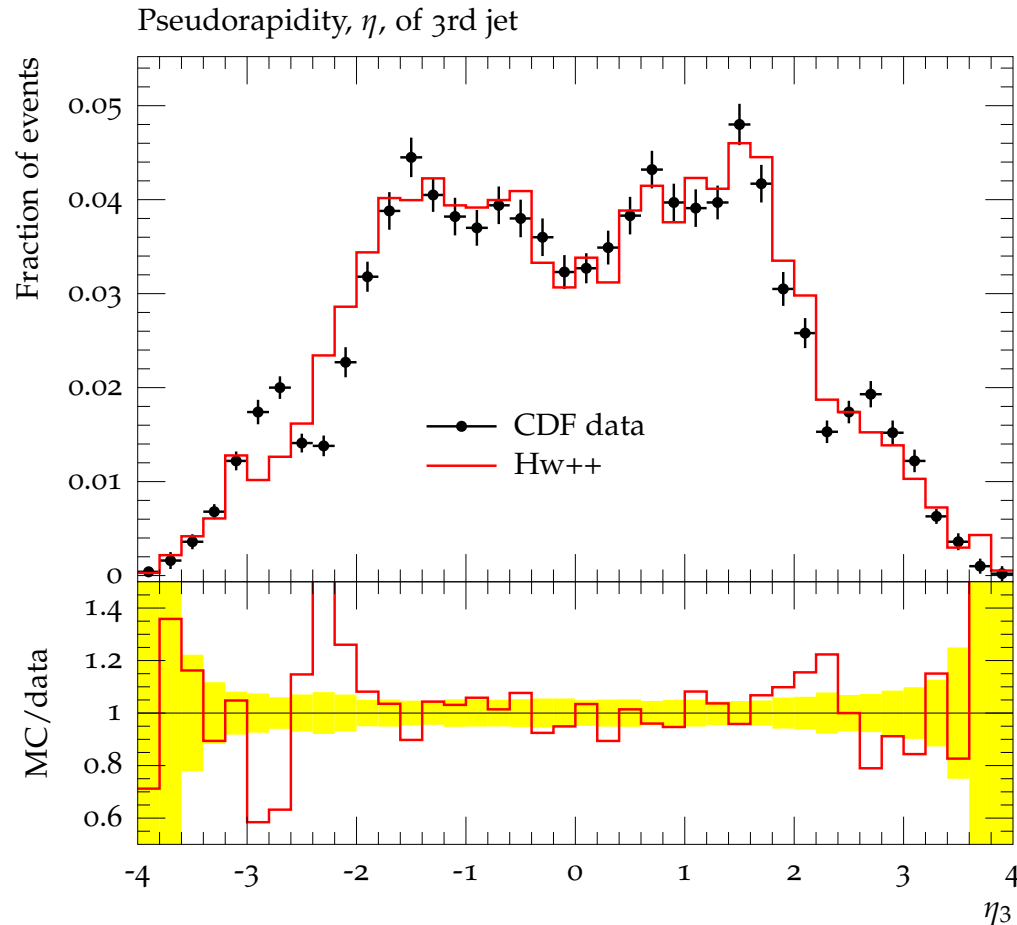

FIG. 13. Observed η_3 distribution compared to the predictions of (a) HERWIG; (b) ISAJET; (c) PYTHIA; (d) PYTHIA+.

F. Abe *et al.* [CDF Collaboration], Phys. Rev. D 50 (1994) 5562.

Best description with angular ordering.

Colour coherence from CDF

Events with 2 hard (> 100 GeV) jets and a soft 3rd jet (~ 10 GeV)

F. Abe *et al.* [CDF Collaboration], Phys. Rev. D 50 (1994) 5562.

Best description with angular ordering.

Initial state radiation

Similar to final state radiation. Sudakov form factor ($x' = x/z$)

$$\Delta(t, t_{\max}) = \exp \left[- \sum_b \int_t^{t_{\max}} \frac{dt}{t} \int_{z_-}^{z_+} dz \frac{\alpha_S(z, t)}{2\pi} \frac{x' f_b(x', t)}{x f_a(x, t)} \hat{P}_{ba}(z, t) \right]$$

Have to **divide out the pdfs.**

Dipoles

Exact kinematics when recoil is taken by *spectator(s)*.

- Dipole showers.
- Ariadne.
- Recoils in Pythia.
- New dipole showers, based on
 - Catani Seymour dipoles.
 - QCD Antennae.
 - Herwig, Sherpa, Vincia, Dire, ...
 - Goal: matching with NLO.
- Generalized to IS–IS, IS–FS.
