

# Migration of STEAM-SIGMA Inputs from Java to python

## *One-week work shadowing*

Wiktor Liśkiewicz  
11.04.2019

TE-MPE-PE

<http://www.cern.ch/STEAM>

I'm 16 years old and I am currently studying Maths, Science, English, Statistics, French, History and Geography at school

I'm spending just this week at CERN during my holidays

As I don't take Computer Science at school my programming skills before my visit here was very limited

# A story from an R&D engineer's life

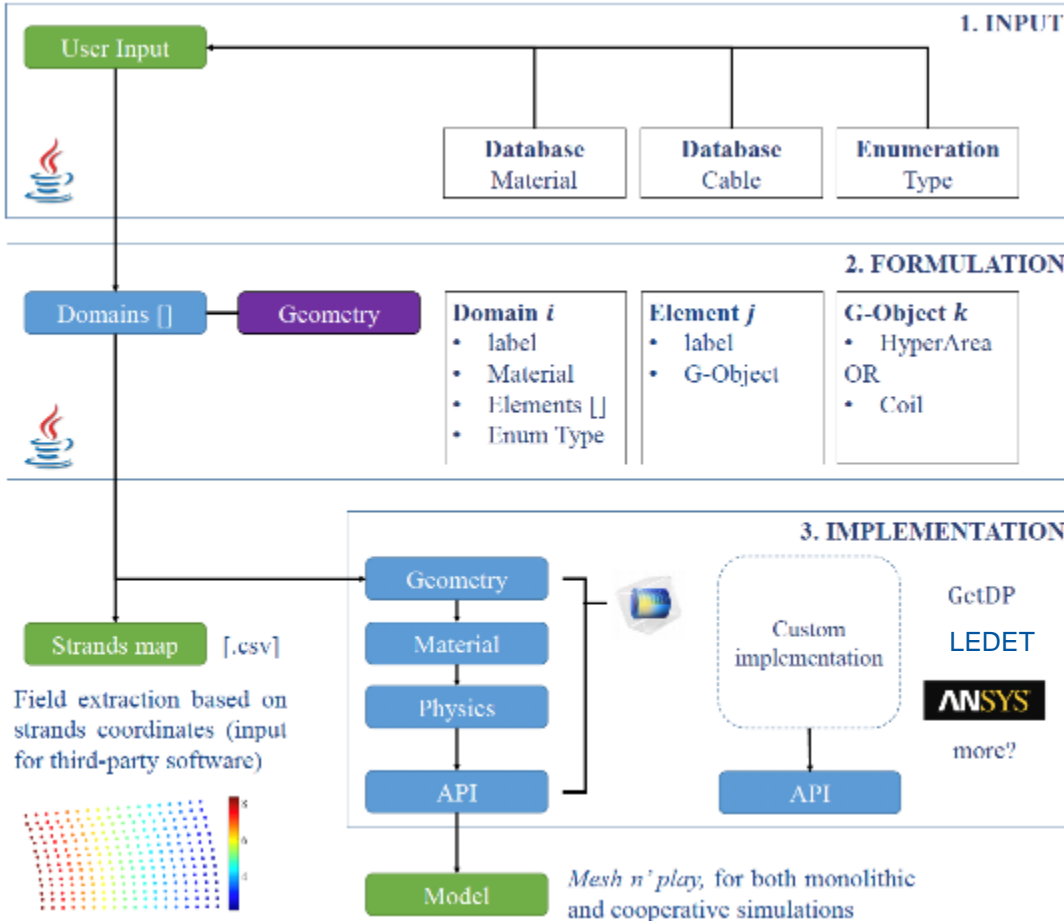

0. A curiosity-driven request to perform a study for: LHC, HL-LHC, FCC\*
1. Numerical/Analytical analysis to carefully evaluate various scenarios
2. Selection of a handful of working models out of hundreds trials and errors
3. Double-check to convince oneself that the results do make sense
4. Summary of results as a report, note, paper, presentation\*
5. Conscious acceptance of a broken link between 2. and 4.

\*choose one that applies

How can we maintain the link between models and analysis?

# STEAM Integrated Generator of Magnets for Accelerators

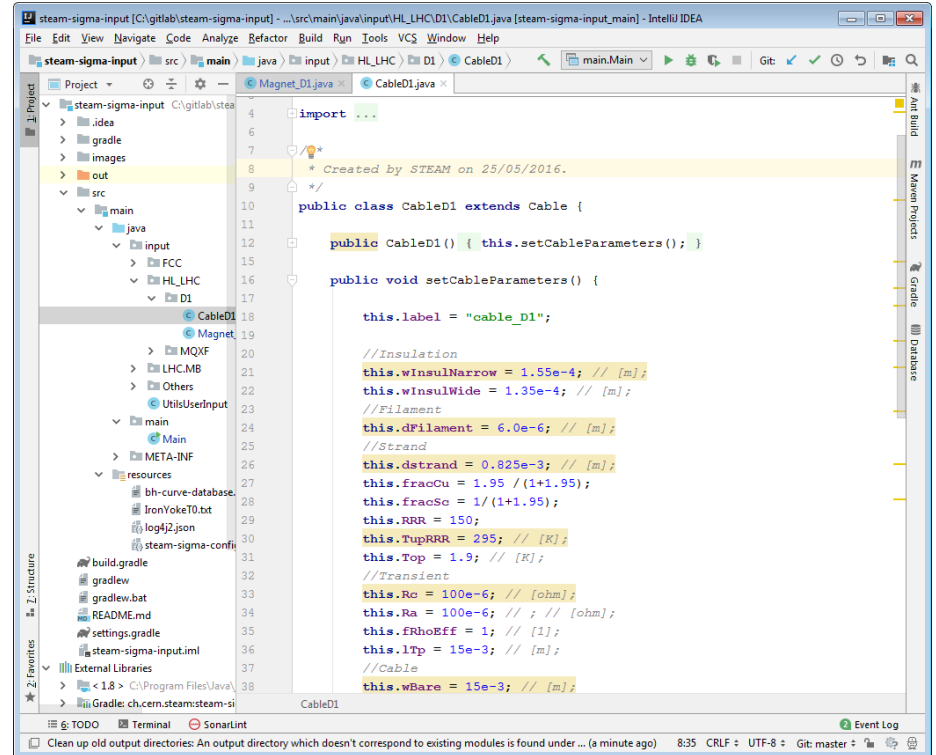

- Mesh & play models
- Construction time of minutes
- Automation against error-prone, manual work

Other models: 11 Tesla, D1, ... and many more!

# The Challenge: Make STEAM-SIGMA user-friendly

- X Expert tool for Java development
- X Multi-stage installation process
- X Issues with dependencies
- X Big overhead of project files
- X Geometry visualization not supported

```
import ...

/*
 * Created by STEAM on 25/05/2016.
 */

public class CableD1 extends Cable {

    public CableD1() { this.setCableParameters(); }

    public void setCableParameters() {

        this.label = "cable_D1";

        //Insulation
        this.wInsulNarrow = 1.55e-4; // [m]
        this.wInsulWide = 1.35e-4; // [m];
        //Filament
        this.dFilament = 6.0e-6; // [m];
        //Strand
        this.dstrand = 0.825e-3; // [m];
        this.fracCu = 1.95 / (1+1.95);
        this.fracSc = 1 / (1+1.95);
        this.RRR = 150;
        this.TopRRR = 295; // [K]
        this.Top = 1.9; // [K];
        //Transient
        this.Rc = 100e-6; // [ohm];
        this.Ra = 100e-6; // [ohm];
        this.fRhoEff = 1; // [1];
        this.lTp = 15e-3; // [m];
        //Cable
        this.wBare = 15e-3; // [m];
    }
}
```

The initial time investment (to learn Java and IntelliJ) is unacceptable for our users

# The Solution: SWAN Notebooks - demo

- ✓ Environment tailored for scientists
- ✓ No installation – runs in a browser
- ✓ No issues with dependencies
- ✓ Only input files, lean projects
- ✓ Geometry visualization supported

# Java to python parsing

There are 12 STEAM-SIGMA inputs to be migrated (1 done and tested)

## Geometry

```
Point kpc = Point.ofCartesian(0, 0);  
Point kp1 = Point.ofCartesian(r, 0);
```

## Cable parameters

```
this.wInsulNarrow = 1.55e-4; // [m];  
this.wInsulWide = 1.35e-4; // [m];
```

```
kpc = Point.ofCartesian(0.0, 0.0)  
kp1 = Point.ofCartesian(r, 0.0)
```

```
cableD1.setwInsulNarrow(1.55e-4)  
cableD1.setwInsulWide(1.35e-4)
```

# Cable Parameters Parser - Demo

```
inputString = 'this.wInsulNarrow = 1.55e-4;'
```

A parser would change the  
java input into the python  
output

Expected Output

```
cabelD1.setwInsulNarrow ( 1.55e-4)
```

This parser works for all cable inputs

# Magnet Geometry Parser - Demo

```
inputString = 'Element ho3_3 = new Element("IY_HOLE3_3", ar3_3);'
```

A parser would change the  
java input into the python  
output

Output python statement: `ho3_3 = Element("IY_HOLE3_3", ar3_3)`

A similar code can be used for all geometry inputs

# Summary

Following the Model-Based System Engineering Methodology, we do believe that:

1. Models are repositories of data and the link with reports should be maintained for the future use
2. Models should originate from a “single-source-of-truth”, so a single notebook
3. Python notebooks can be enhanced with simple analytical calculation (MIITs curve, RL circuit analysis, etc.)

Java to python parser is partially completed (cable parameters done, geometry in progress) and will be applied to migrate the remaining 12 STEAM-SIGMA inputs

1. What I liked - How simple it is, I came with basically no programming experience yet I was able to contribute and work
2. What I learnt – I learnt some programming and python skills (for loops, reading/writing files, etc.)
