【122】 Temperature dependent photoemission study of the charge-ordered phases in IrTe₂

Thursday 29 August 2019 17:15 (15 minutes)

We investigate the electronic structure of IrTe₂ to elucidate the origin of its charge-ordered phase transitions. Here, we present an X-ray photoemission spectroscopy study as a function of temperature across the IrTe₂ phase transitions. Our surface sensitive measurements reveal new results on the specific nature of the transitions in contradiction with the literature. According to our measurements, the transition at 270 K remains first-order, occurring within only a few Kelvin, while the transition at 180 K is second-order, developing over a range of several tens of Kelvin. In parallel, we perform an angle-resolved photoemission spectroscopy study as a function of temperature, which allows us to confirm the previous deductions.

Author: Mr RUMO, Maxime (Université de Fribourg)

Co-authors: Dr NICHOLSON, Christopher William (Université de Fribourg); Dr JAOUEN, Thomas (Université de Fribourg); Dr MOTTAS, Marie-Laure (Université de Fribourg); Dr KREMER, Geoffroy (Université de Fribourg); Mr SALZMANN, Bjorn (Université de Fribourg); Dr PULKKINEN, Aki (LUT Université); Prof. BARBIELLINI, Bernardo (LUT University); Prof. VON ROHR, Fabian (University of Zurich); Prof. AEBI, Philipp (Université de Fribourg); Prof. MONNEY, Claude (Université de Fribourg)

Presenter: Mr RUMO, Maxime (Université de Fribourg)

Session Classification: Condensed Matter Physics

Track Classification: Condensed Matter Physics (KOND)
