Lensing convergence and anisotropic dark energy in galaxy redshift surveys

Thursday, 5 December 2019 15:20 (20 minutes)

Analyses of upcoming galaxy surveys will require careful modelling of relevant observables such as the power spectrum of galaxy counts in harmonic space $C_l(z, z')$. We investigate the impact of disregarding relevant relativistic effects by considering a model of dark energy including constant sound speed, constant equation of state w_0 , and anisotropic stress. Here we show that neglecting the effect of lensing convergence will lead to substantial shifts in cosmological parameters such as the galaxy bias b_0 , the value of the dark energy equation of state today w_0 , and the Hubble constant H_0 . Interestingly, neglecting the effect of lensing convergence in this kind of models results in shifting H_0 downwards, something which could shed light on the current tension between local and CMB determinations of the Hubble constant.
