## Heavy quarks within the electroweak multiplet

*Wednesday, 4 December 2019 15:20 (20 minutes)*

Standard-model fields and their associated electroweak Lagrangian are equivalently expressed in a shared spin basis. The scalar-vector terms are written with scalar-operator components acting on quark-doublet elements, and shown to be parametrization-invariant. Such terms, and the t- and b-quark Yukawa terms are linked by the identification of the common mass-generating Higgs operating upon the other fields, after acquiring a vacuum expectation value  $v$ . Thus, the customary vector masses are related to the fermions', fixing the t-quark mass  $m_t$  with the relation  $m_t^2 + m_b^2 = v^2/2$  either for maximal hierarchy, or given the b-quark mass  $m_b$ . A sum rule is derived for all quark masses that generalizes this restriction. An interpretation follows that electroweak bosons and heavy quarks belong in a multiplet.
