The CERN Neutrino Platform and the Neutrino programme at CERN

Thursday, 24 October 2019 12:00 (30 minutes)

Neutrino activities at CERN have strongly developed in recent years, following the recommendation of the European Strategy Group issued in 2013: “to pave the way to the for a substantial European role in future long-baseline experiments”. A large facility for R&D and test of neutrino detectors has grown. The main programmes will be discussed, including the prototypes of the DUNE long-baseline project, contributions to the Short Base-line Neutrino project at FNAL and to the Near Detector upgrade for T2K. Physics studies currently taking place will also be illustrated.
