

Development and optimization of mpdroot software

DANIEL OSIŃSKI

WOJCIECH ŻURKOWSKI

SUPERVISOR - OLEG ROGACHEVSKY

Outline

- Why do we need mpdroot?
- Event reconstruction
- Is mpdroot everything we need?
- Main task - remove warnings
- Other task - macros overview
- Some code example
- Task for the future

Why do we need mpdroot?

mpdroot

Source: mpd.jinr.ru

Event reconstruction

Hit reconstruction in subdetectors

Tracking

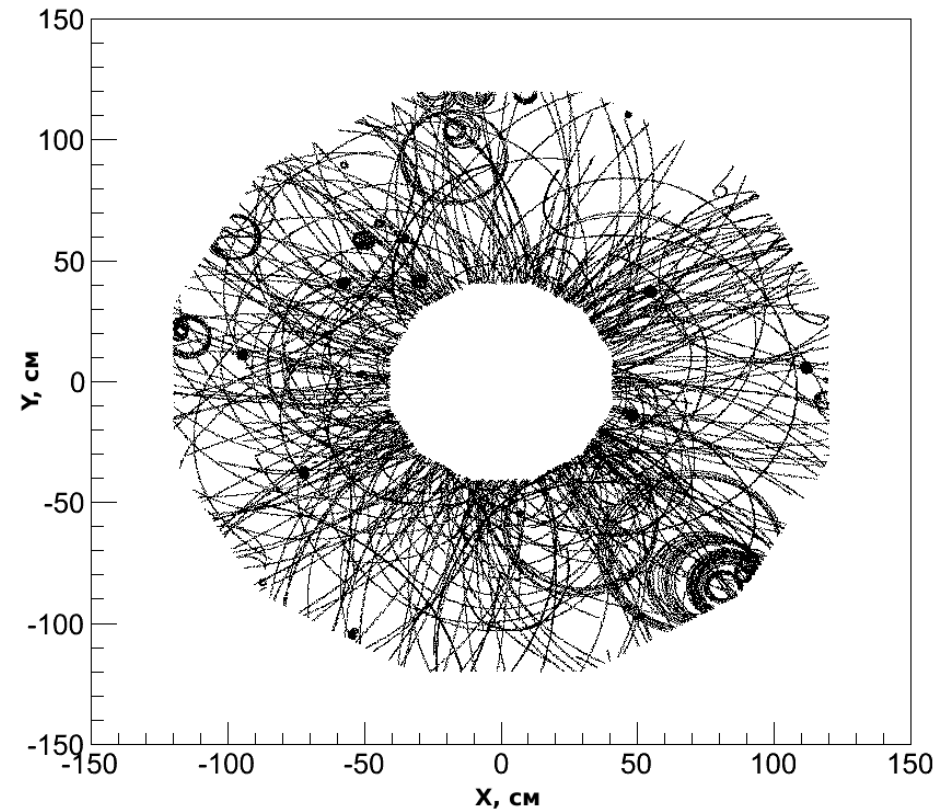

Vertex finding

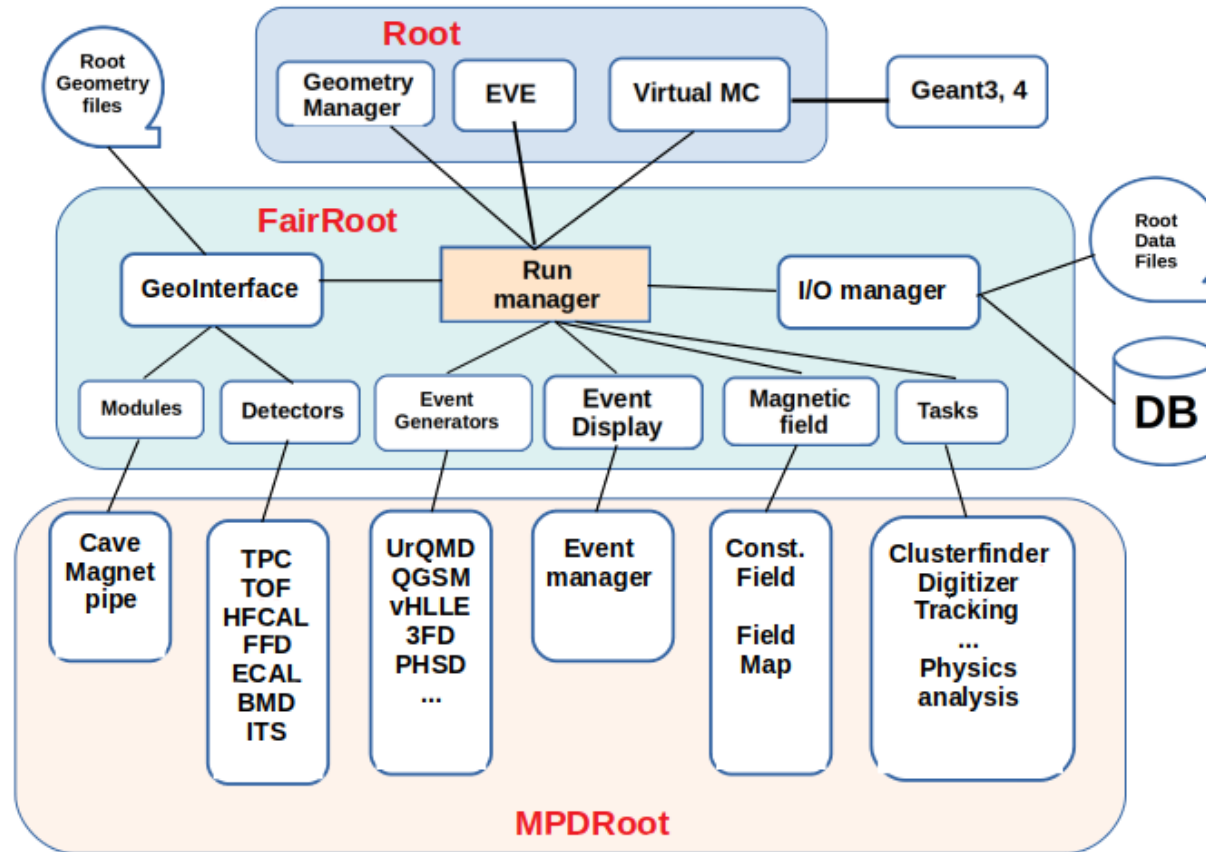

Particle identification

Reconstruction and tracking

Source: mpd.jinr.ru

Is mpdroot everything we need?

Source: O. Rogachevsky

Main task – remove warnings

From 166 to 0

- All warnings removed
- 1 311 569 lines of code
- Documentation in git for all changes

Most common mistakes

- No return statement
- Redeclarations
- Deprecated function from FairLogger
- Shadowed variables

Other mistakes

- Wrong usage of `abs()`
- Mistake in `fprintf()` format

No return statement

```
99 99 off_t MpdLibZ::seek(off_t pos, int whence)
100 100 {
101 101     switch (whence)
102 102     {
103 103         case 0:
104 104             return gzseek(file, pos, SEEK_CUR);
105 105         case 1:
106 106             return gzseek(file, pos, SEEK_SET);
107 107     }
108 108 + return -1;
108 109 }
```

Redeclarations

```
508 508     Int_t lay = 1; // layer 1
509 509     fLayBeg[0] = 0; // index for layer 1
510 510     for (Int_t i1 = 0; i1 < nHits; ++i1) {
511 511         MpdStsHit *h = (MpdStsHit*) fItsHits->UncheckedAt(i1);
512     -     Int_t lay = h->Layer();
512     +     lay = h->Layer();
513 513         if (lay0 != lay) {
514 514             fLayBeg[lay - 1] = i1;
515 515             lay0 = lay;
516 516         }
517 517     }
```

Deprecated function from FairLogger

```
164 164 void TpcDetector::ConstructGeometry() {
165 165     TString fileName = GetGeometryFileName();
166 166
167 167     if ( fileName.EndsWith(".root") ) {
168     -         gLogger->Info(MESSAGE_ORIGIN,
169     -                     "Constructing TPC geometry from ROOT file %s",
170     -                     fileName.Data());
168 +         LOG(INFO) << "Constructing TPC geometry from ROOT file " << fileName.Data() << endl;
171 169         ConstructRootGeometry();
172 170     }
173 171     else if ( fileName.EndsWith(".geo") ) {
```

Shadowed variables

```
166 166 | set<Int_t>::iterator it = fDigiset[isec][irow].begin();

190 190 |     for (Int_t ip = 0; ip < 2; ++ip) {
191 -   |         for (Int_t it = 0; it < 2; ++it) {
192 -   |             if (it == ip) continue;
193 -   |             Int_t ip1 = ipad + ip, it1 = itime + it;
191 +   |         for (Int_t it_loop = 0; it_loop < 2; ++it_loop) {
192 +   |             if (it_loop == ip) continue;
193 +   |             Int_t ip1 = ipad + ip, it1 = itime + it_loop;
194 194 |         if (ip1 >= fgkNpads) continue;
```

Other task – macros overview

Statistic

- Summary – 150
- Working – 16

Main macros

- reco.C
- runMC.C

Task for the future

- Clean the existing code
- Remove unused classes
- Improve the macros
- Add new macros
- Remove existing memory leakage
- Release a updated software
- Create validation test system for mpdroot

Thank you for
your attention!
