Compact 

Consideration of the photon beamline design for CompactLight

Vitaliy Goryashko, Peter Salen

CompactLight Meeting, Helsinki, 2019

“The key objective of CompactLight is to demonstrate, through a conceptual design, the feasibility of an innovative, compact and cost effective **FEL facility**.”

*The beamline design is currently **not** included.*

The aims of this presentation are to introduce the basics of FEL beamlines and point out the need to consider the beamline design for CompactLight.

- A few more words about science requirements
- Purpose and key characteristics of the X-ray beamline
- Types and examples of beamlines
- Considerations of the beamline for CompactLight

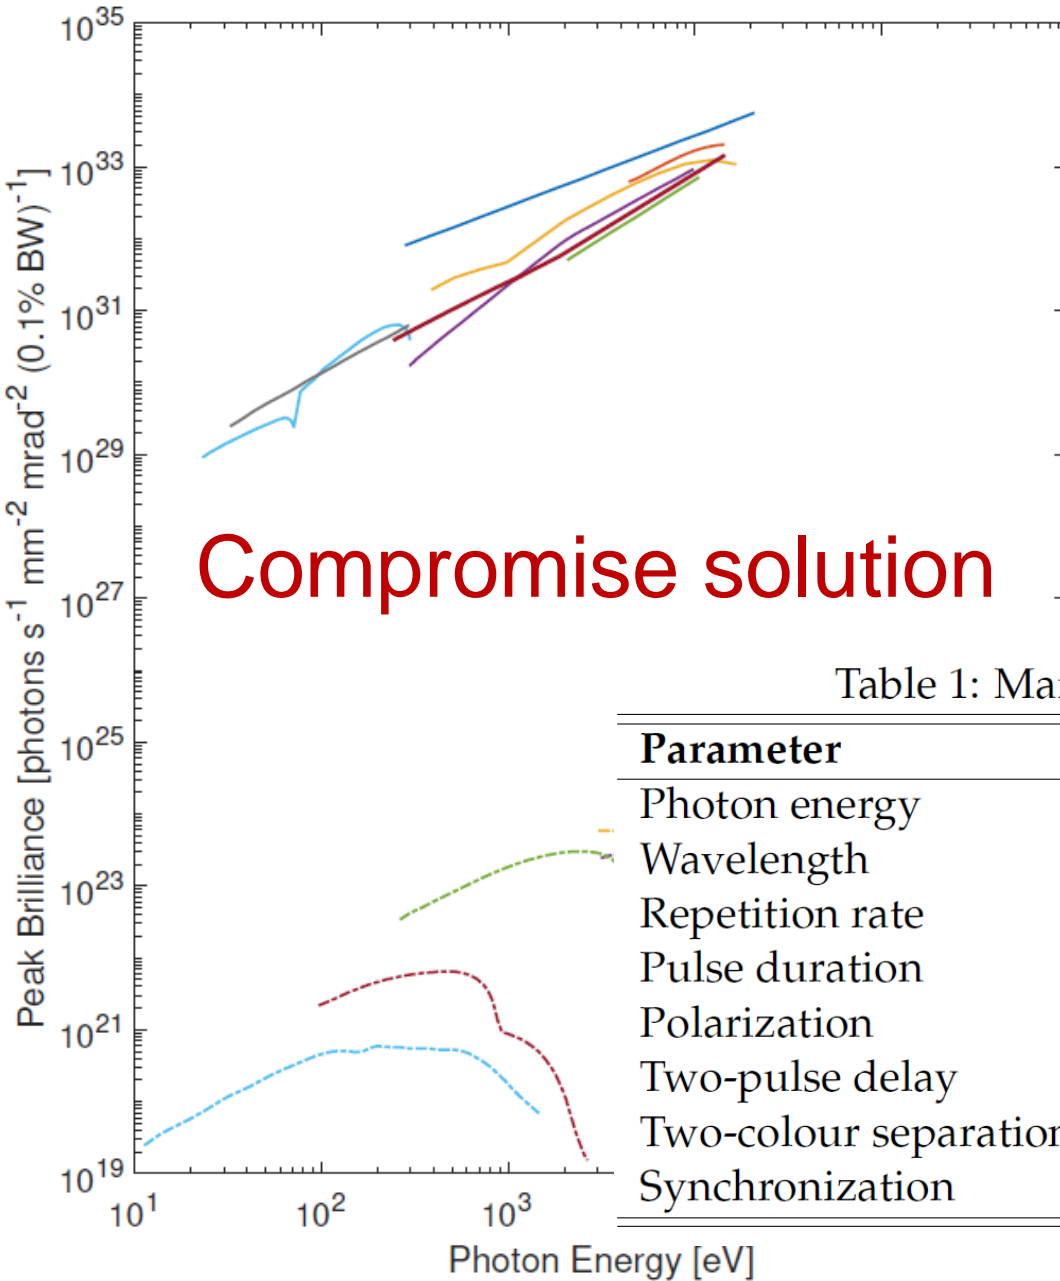

Science Requirements and Performance Specification for the CompactLight X-Ray Free-Electron Laser

Table 1: Main parameters of the CompactLight FEL.

Parameter	Unit	Soft-x-ray FEL	Hard-x-ray FEL
Photon energy	keV	0.25 – 2.0	2.0 – 16.0
Wavelength	nm	5.0 – 0.6	0.6 – 0.08
Repetition rate	Hz	1000	100
Pulse duration	fs	0.1 – 50	1 – 50
Polarization		Variable, selectable	Variable, selectable
Two-pulse delay	fs	±100	±100
Two-colour separation	%	20	10
Synchronization	fs	<10	<10

Table 2: Photon characteristics specified by potential users in the online questionnaire. Blue columns correspond to diffraction or scattering experiments. Yellow columns correspond to spectroscopy. Orange columns correspond to interactions between x-ray and matter. Grey columns correspond to other experiments.

Min. photon energy [keV]	4.5	0.05	0.01	3	1	0.5	0.5	0.01	1	0.2	3	3	0.7	0.5	2	0.2
Max. photon energy [keV]	12.6	7	10	20	12	10	15	0.5	9	10	16	16	10	10	20	20
Repetition rate [Hz]	120	1000	100000	1.1		100	1000	100000000	120	1000000	1000000	4500000	100	10000	1000	1000000
Pulse energy [μ J]	100	250	100	1000	2000	1	5		3000	10000	2000	5000	10	10	10	100
RMS pulse energy stability [%]	20	10	10	0.1	1	10	1		10	10	10	10	10	0.1	0.01	5
Microfocus [μ m]	1	1	0.5	10	0.1	10	5		1	0.1	1	0.25	100	100	10	30
Degree of transverse coherence [%]	100	80	100	80			100			90	80	80	100	100	30	10
Coherence time [fs]	1	2	0.2	1							2	10	1	100	50	10
RMS bandwidth [%]	0.05	20	10			0.01	0.01		0.3	0.3	0.5	0.2			10	10
FWHM pulse duration [fs]	10	2	0.2	50		40	10		60	1	50	10	50	10	100	500
Two-pulse spectral separation [nm]	0.6												0	0	100	100
Two-pulse temporal separation [fs]	100	150	10										0	100	10000	1000
Laser-FEL sync [fs]	10	10	1	300		40	10				200	30	50	10	10	5

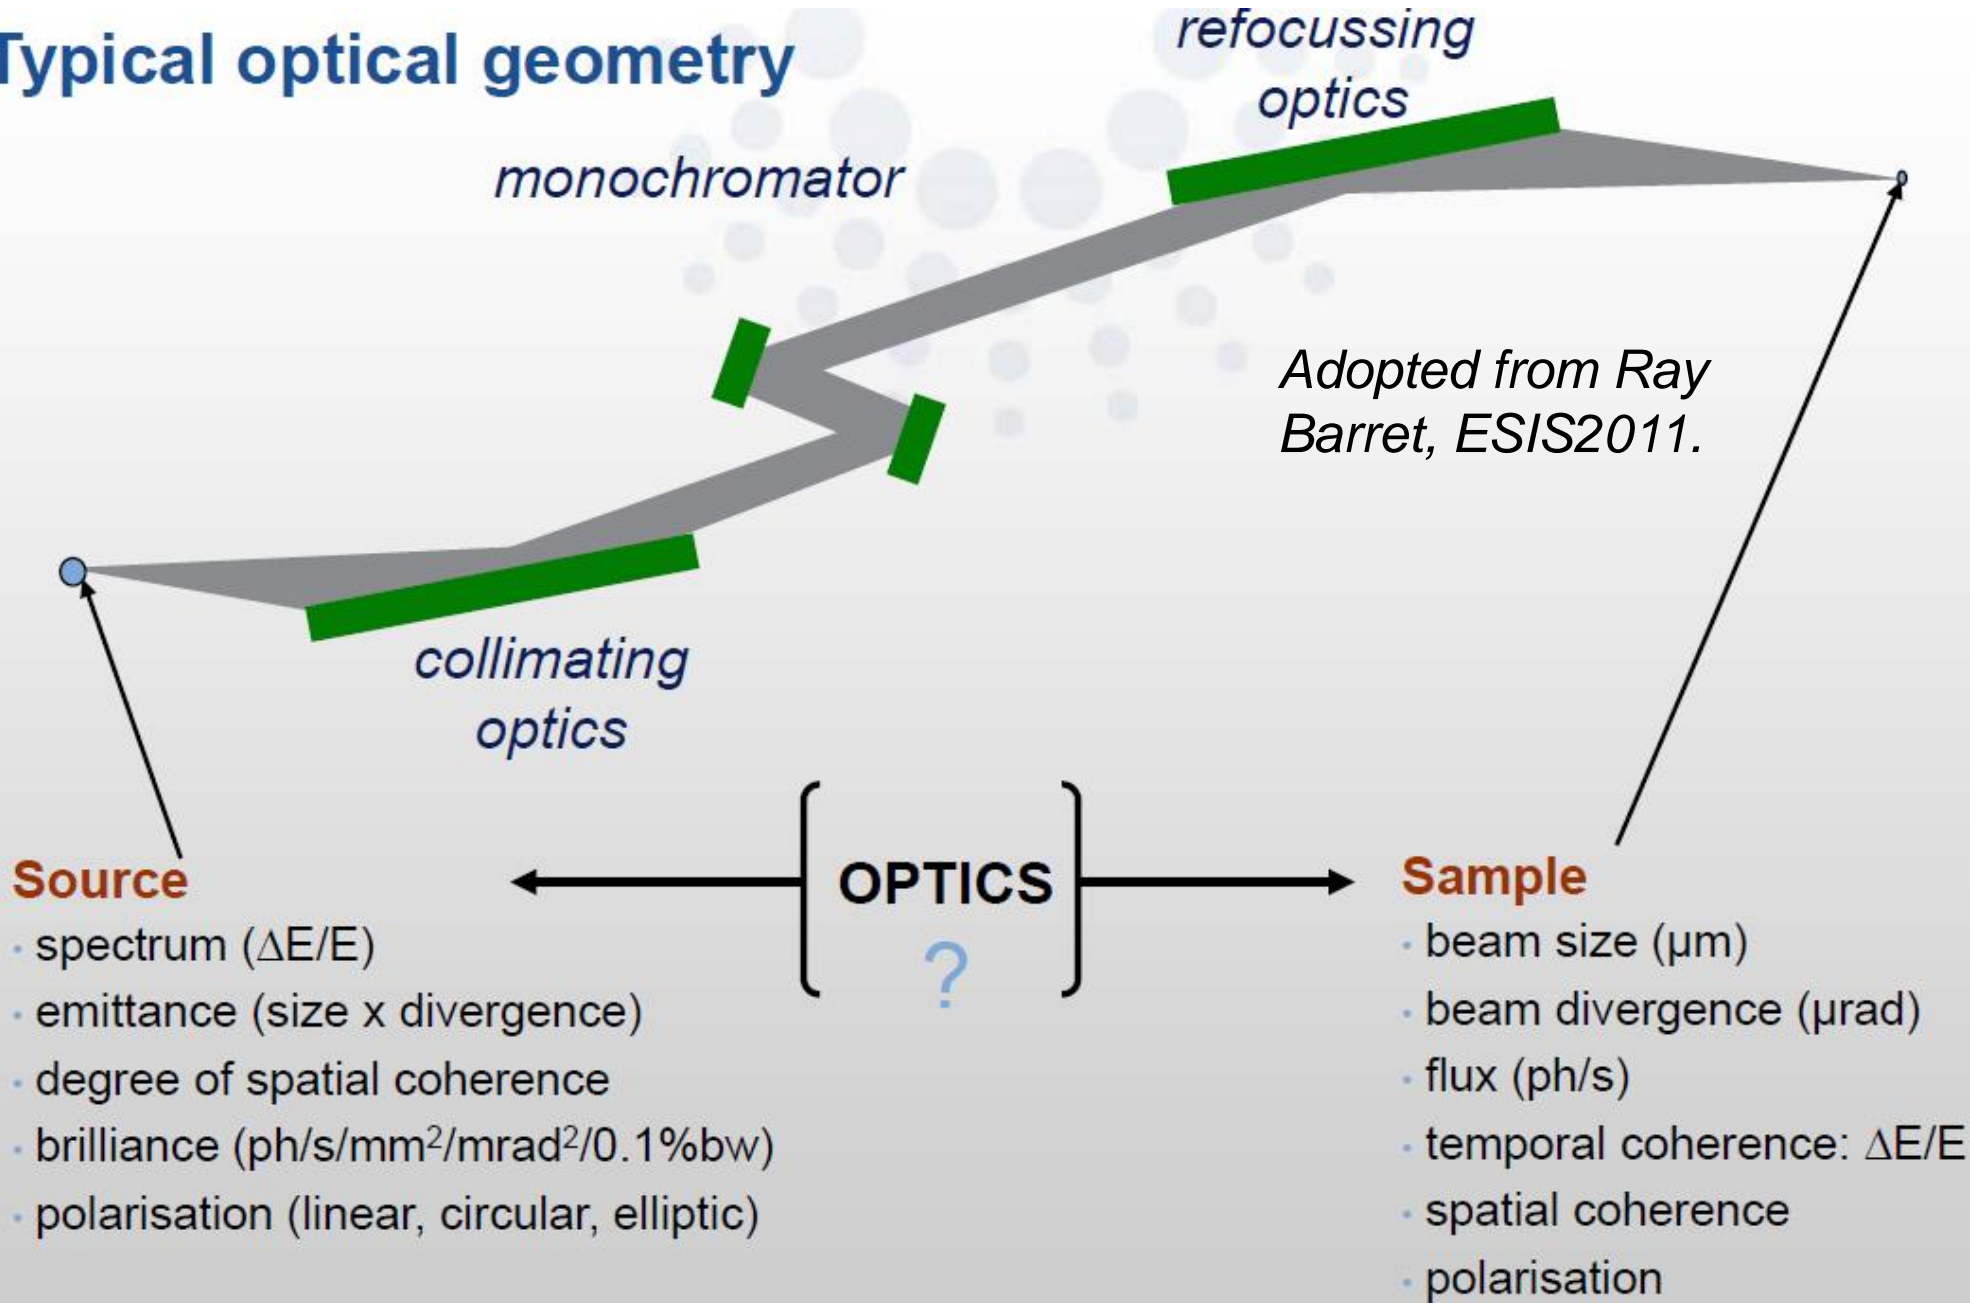

From the survey and discussions it was clear that users think in terms of two main modes of FEL operation:

- **high photon energy resolution mode** – spectroscopic mode
- **high photon pulse energy mode** – imaging mode

Having the requirement of two modes of operation can have, in fact, also implications on the undulator design.

Typical optical geometry

Adopted from Ray Barret, ESIS2011.

Source

- spectrum ($\Delta E/E$)
- emittance (size x divergence)
- degree of spatial coherence
- brilliance ($\text{ph/s/mm}^2/\text{mrad}^2/0.1\%bw$)
- polarisation (linear, circular, elliptic)

← [**OPTICS**] →

?

Sample

- beam size (μm)
- beam divergence (μrad)
- flux (ph/s)
- temporal coherence: $\Delta E/E$
- spatial coherence
- polarisation

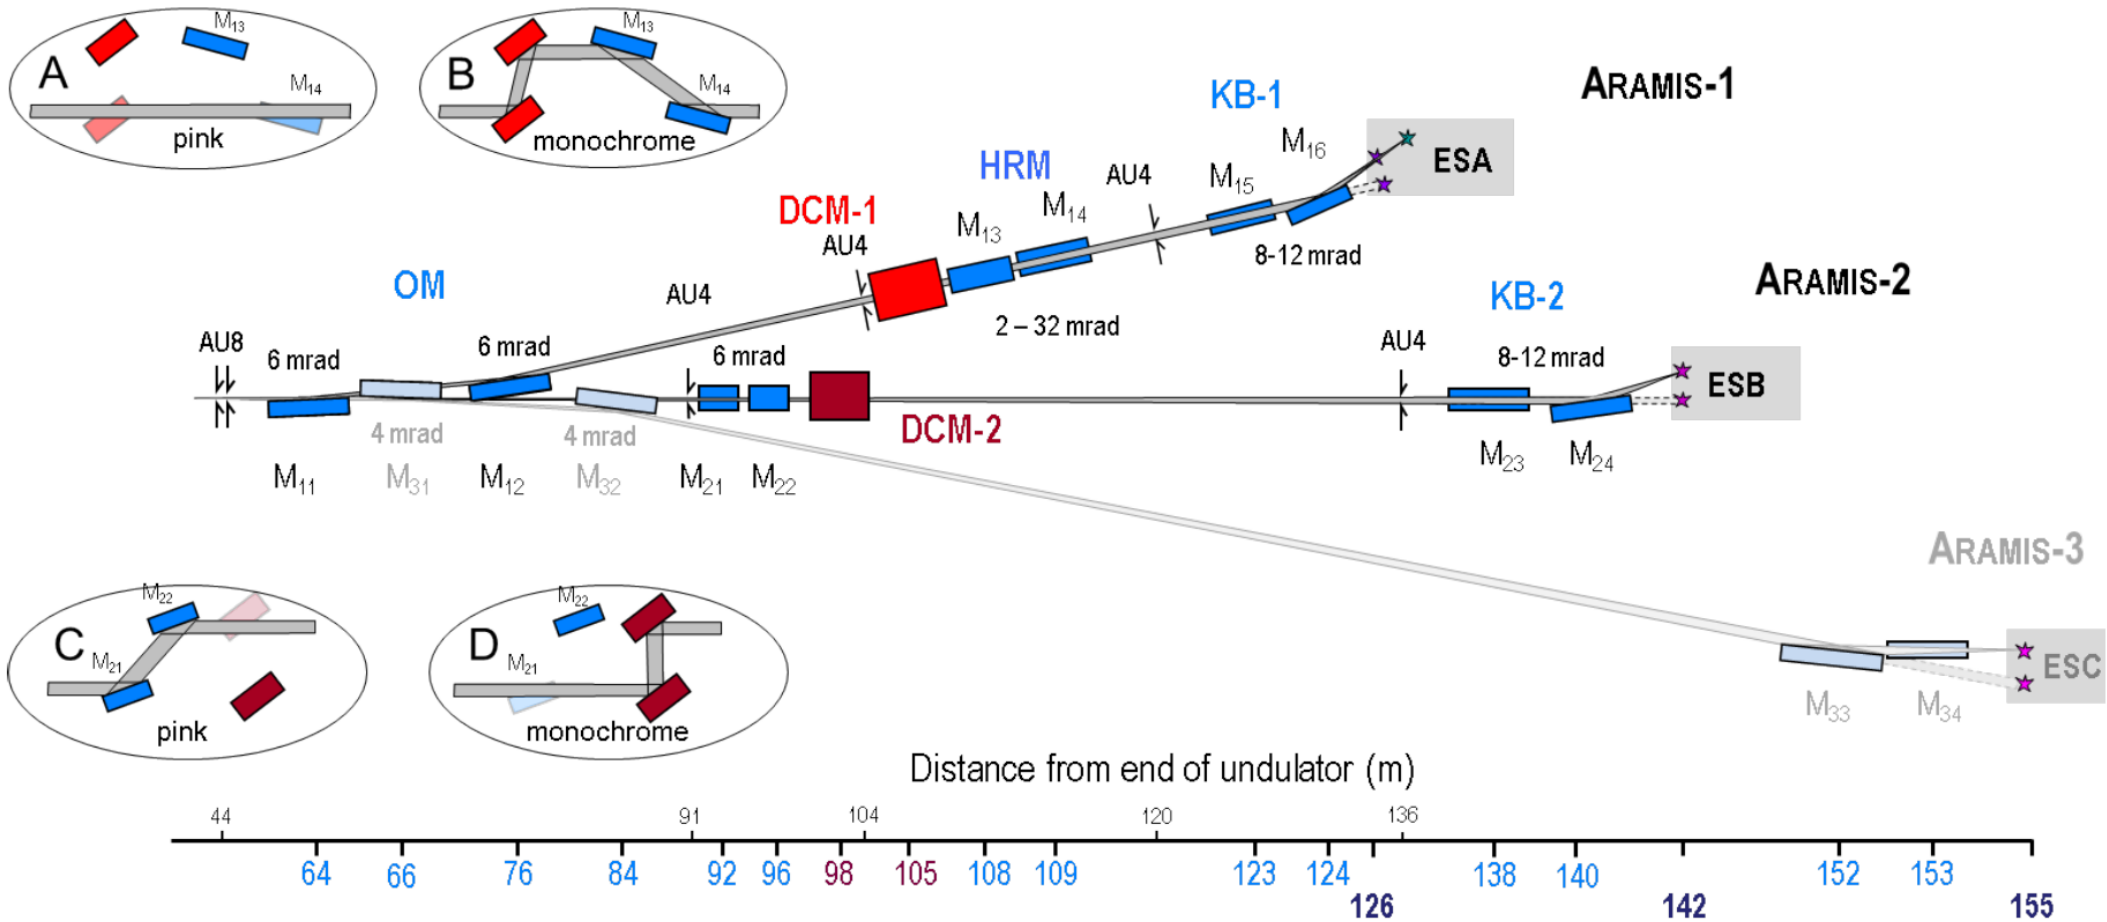

The crystal monochromator makes use Bragg's diffraction whereas mirror reflection is based on total external reflection.

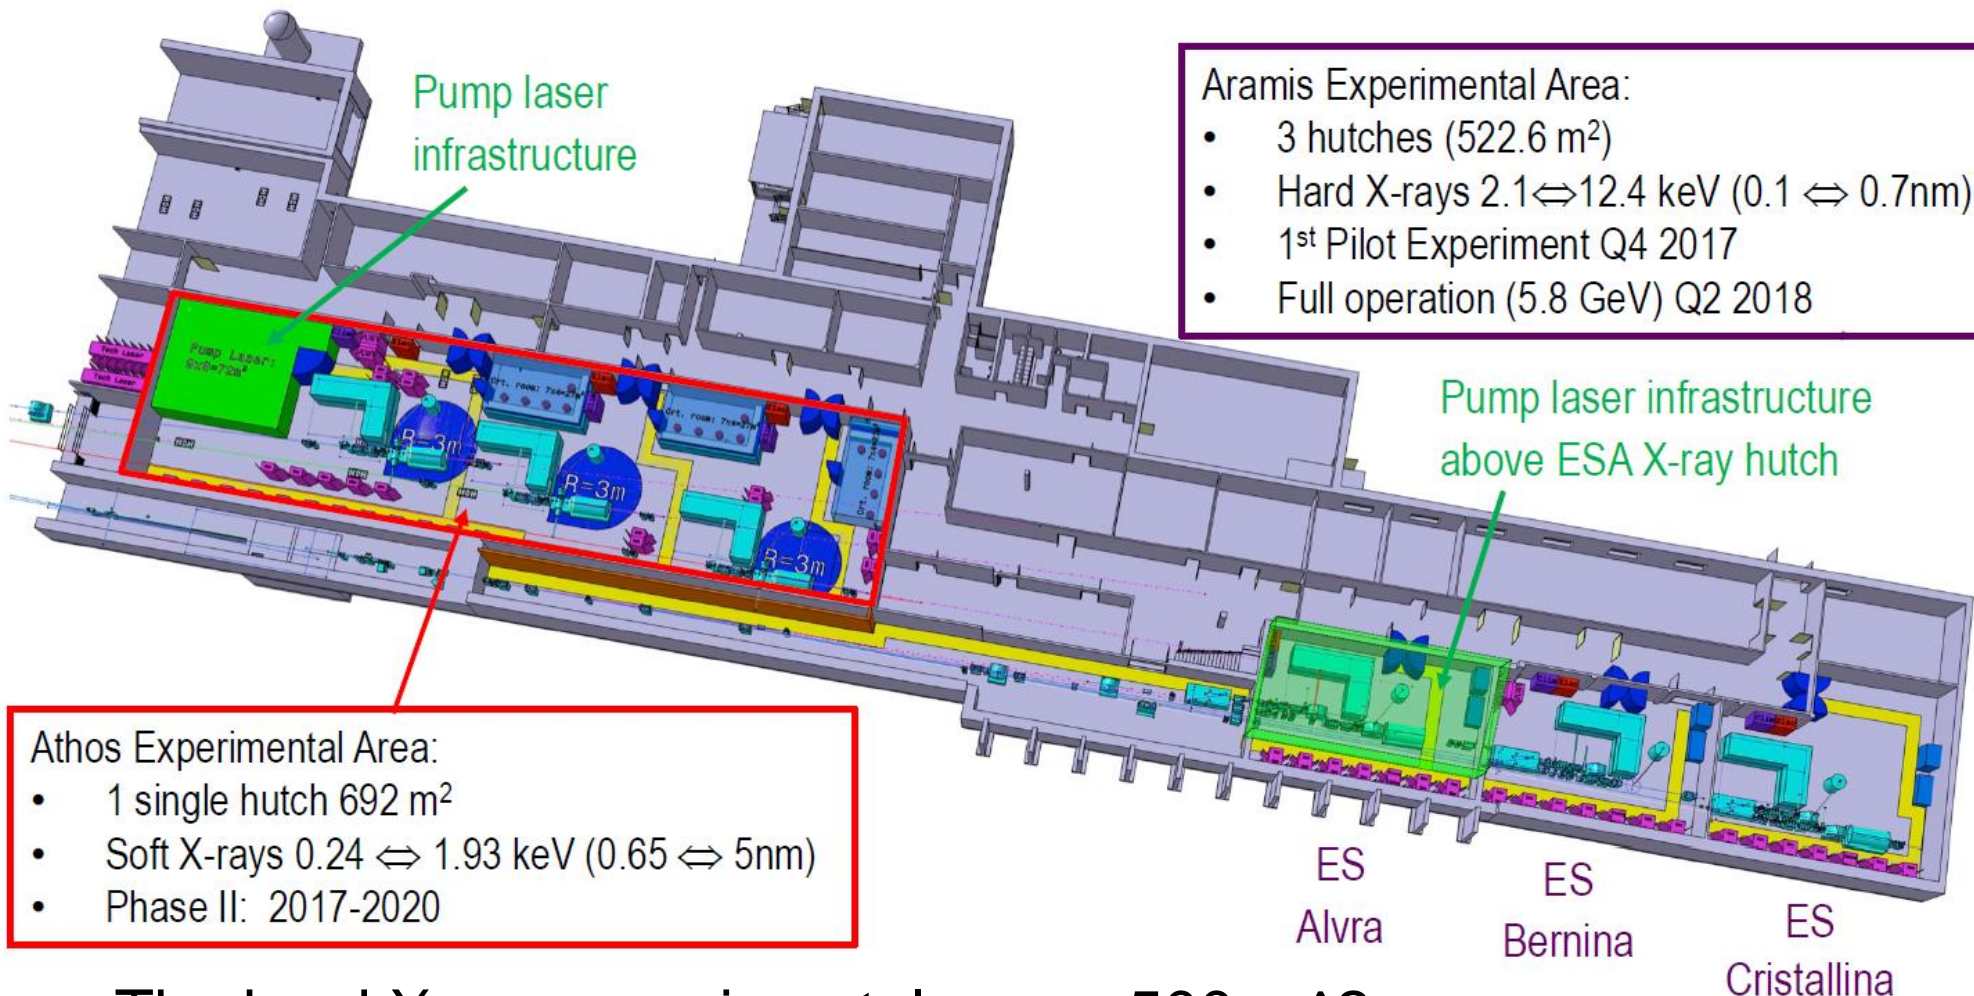

The X-ray beamline constitutes 15 % of the facility length.

- The hard X-ray optical system Aramis is 110 meters long
- It has 2 +1 beamlines
- Each beamline can operate both in the mono and pink modes

Aramis Experimental Area:

- 3 hutches (522.6 m²)
- Hard X-rays 2.1 ⇔ 12.4 keV (0.1 ⇔ 0.7nm)
- 1st Pilot Experiment Q4 2017
- Full operation (5.8 GeV) Q2 2018

Athos Experimental Area:

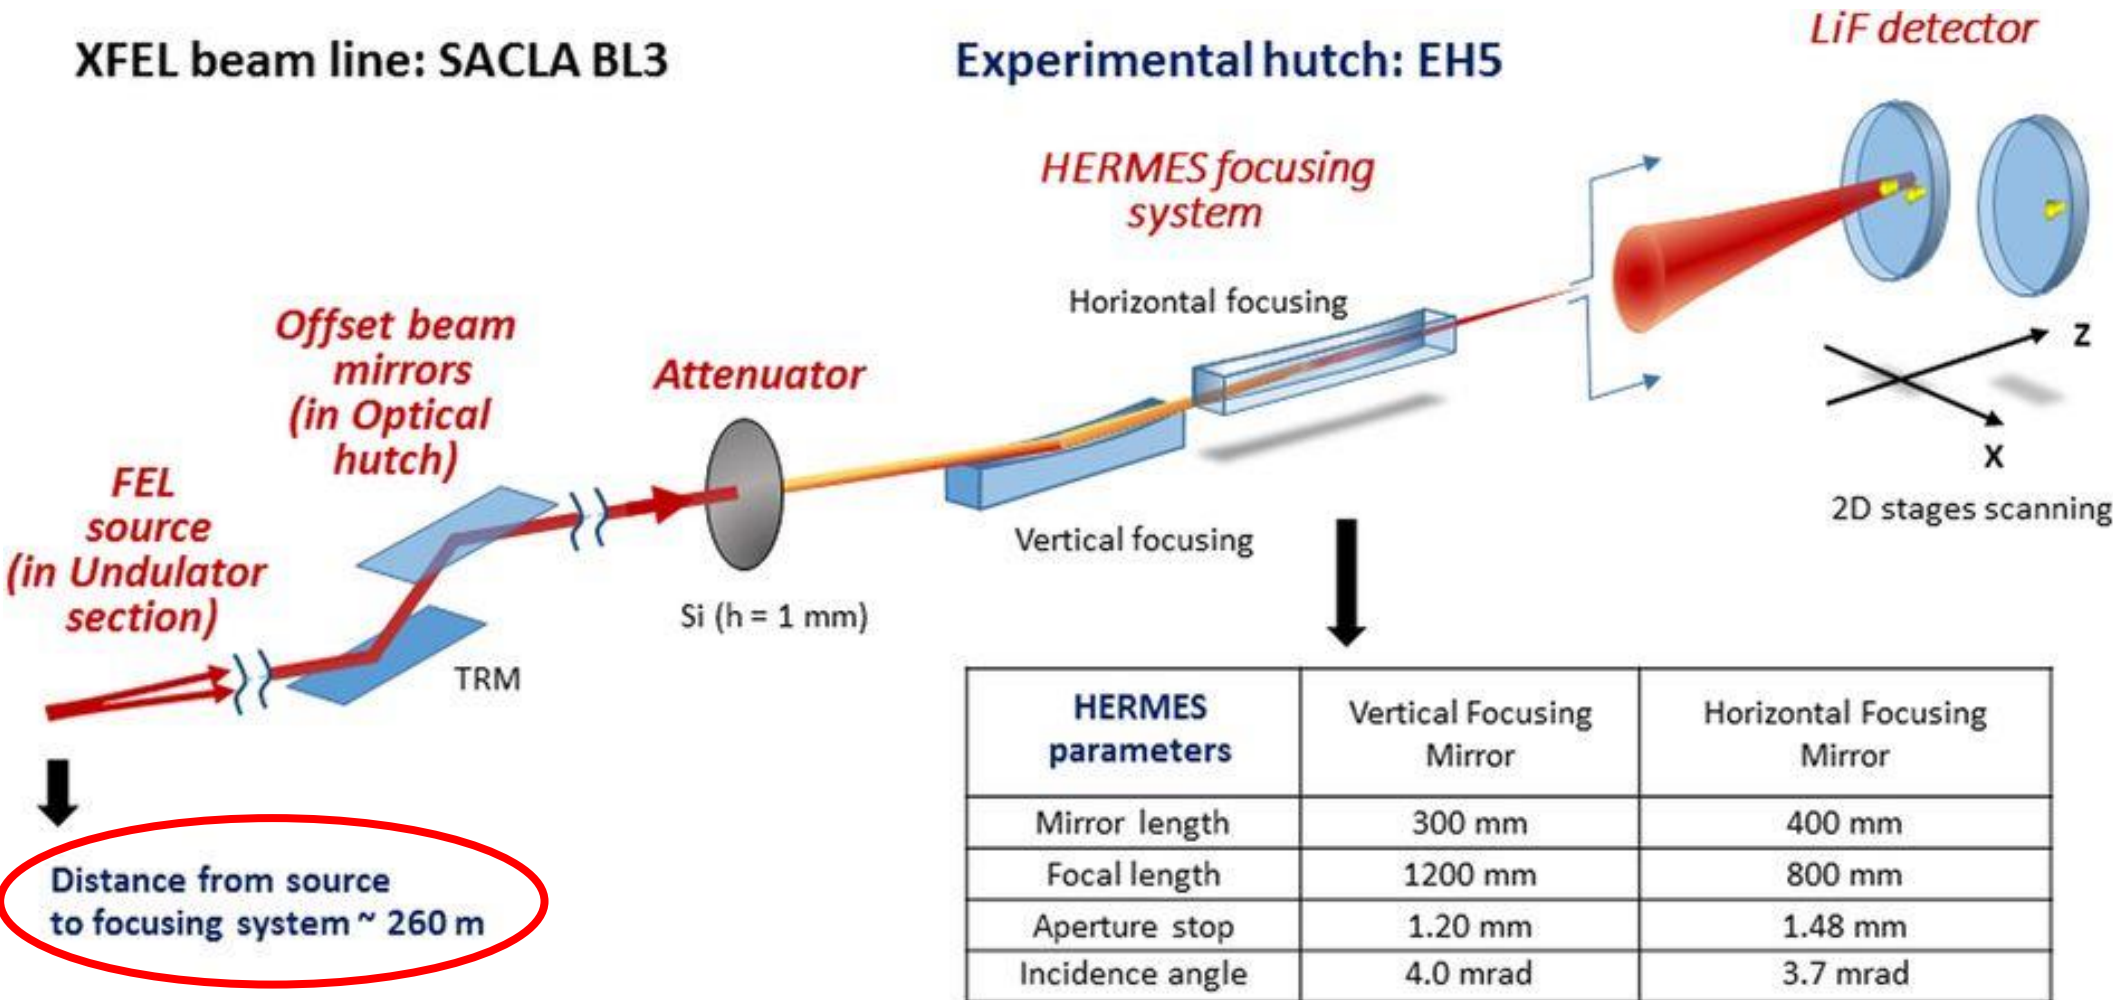

- 1 single hutch 692 m²
- Soft X-rays 0.24 ⇔ 1.93 keV (0.65 ⇔ 5nm)
- Phase II: 2017-2020

- The hard X-ray experimental area ~500 m²
- The soft X-ray experimental area ~700 m²
- Non-negligible impact on the total footprint of the FEL facility

XFEL beam line: SACLA BL3

Experimental hutch: EH5

Source parameters:

Tapered FEL: $E_{\text{pulse}}=1-1.6$ mJ (1-5 nm)

Divergence: 9.3-44.1 μrad FWHM (1-5 nm)

Design by Peter Salen

- In view of the smaller beam energy, the CompactLight FEL would produce pulses with lower pulse energies.
- It is important to optimize photon transport and get as many coherent photons to the sample as possible.
- Maximize the transverse coherence of FEL emission.
- Maximize the emission into the fundamental (transverse) Gaussian mode (minimize M^2).
- Devise a strategy to keep the virtual source position in the undulator matched to the focus of the steering mirror.
- Consider performing monochromatization in the undulator. The conventional monochromator has only a few percent efficiency.

- The beamline is an essential component of the FEL facility.
- The typical length is at least 100 meters. This needs to be taken into account when planning the facility.
- While designing the linac and undulator, we may want to think in terms of the mono and pink operation modes.
- The efficiency of the monochromator is $< 2-5 \%$. Important to study options for performing monochromatization in the undulator.
- The CompactLight FEL cannot deliver high pulse energies. Hence, we need to consider nm-scale focusing.
- In Uppsala, we are building competence in designing FEL beamlines and can offer to investigate the options for the beamline design for CompactLight.

Thank you!
