

# Introduction to Accelerators

## *Physics and Particle Colliders*

Emmanuel Tsesmelis  
CERN & University of Oxford  
*JAI APPEAL 10*  
6 July 2019

# Introduction

# The Three Frontiers

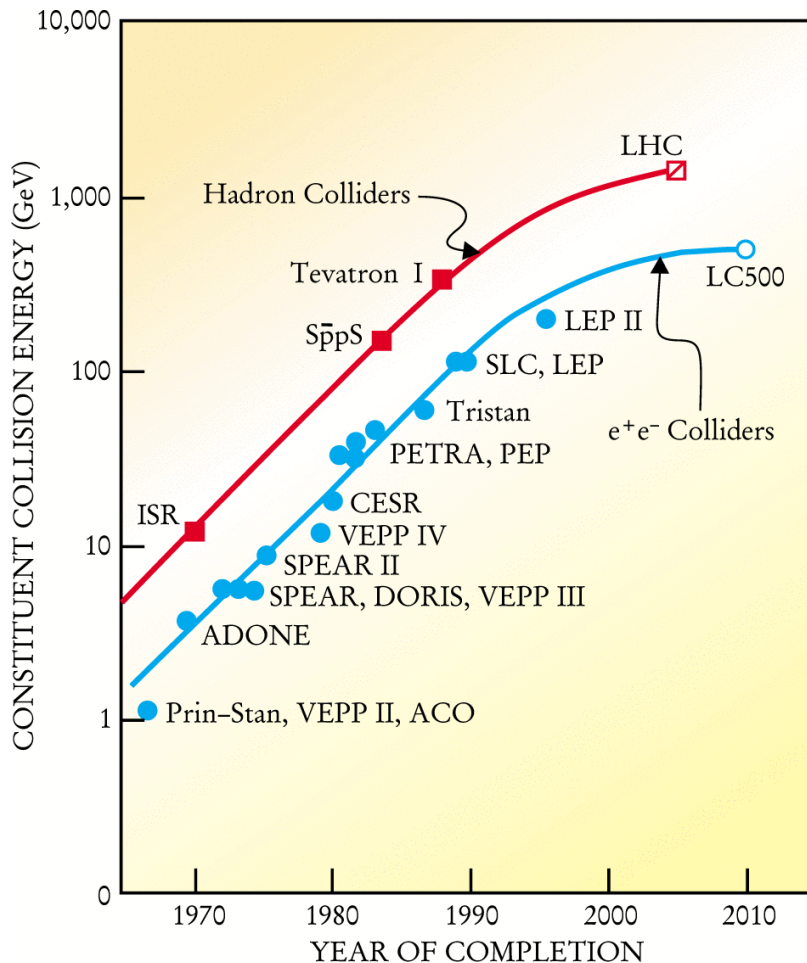

# Accelerator Development

- Characterised by rapid progress for over a century.
  - From cathode-ray tubes to the LHC.
  - From the discovery of the electron to the discovery of the Higgs boson.
- Advances in accelerators require corresponding advances in accelerator technologies
  - Magnets, vacuum systems, RF systems, diagnostics,...
- But timelines becoming long, requiring:
  - Long-term planning.
  - Long-term resources.
  - Global collaboration.

# Livingston Plot

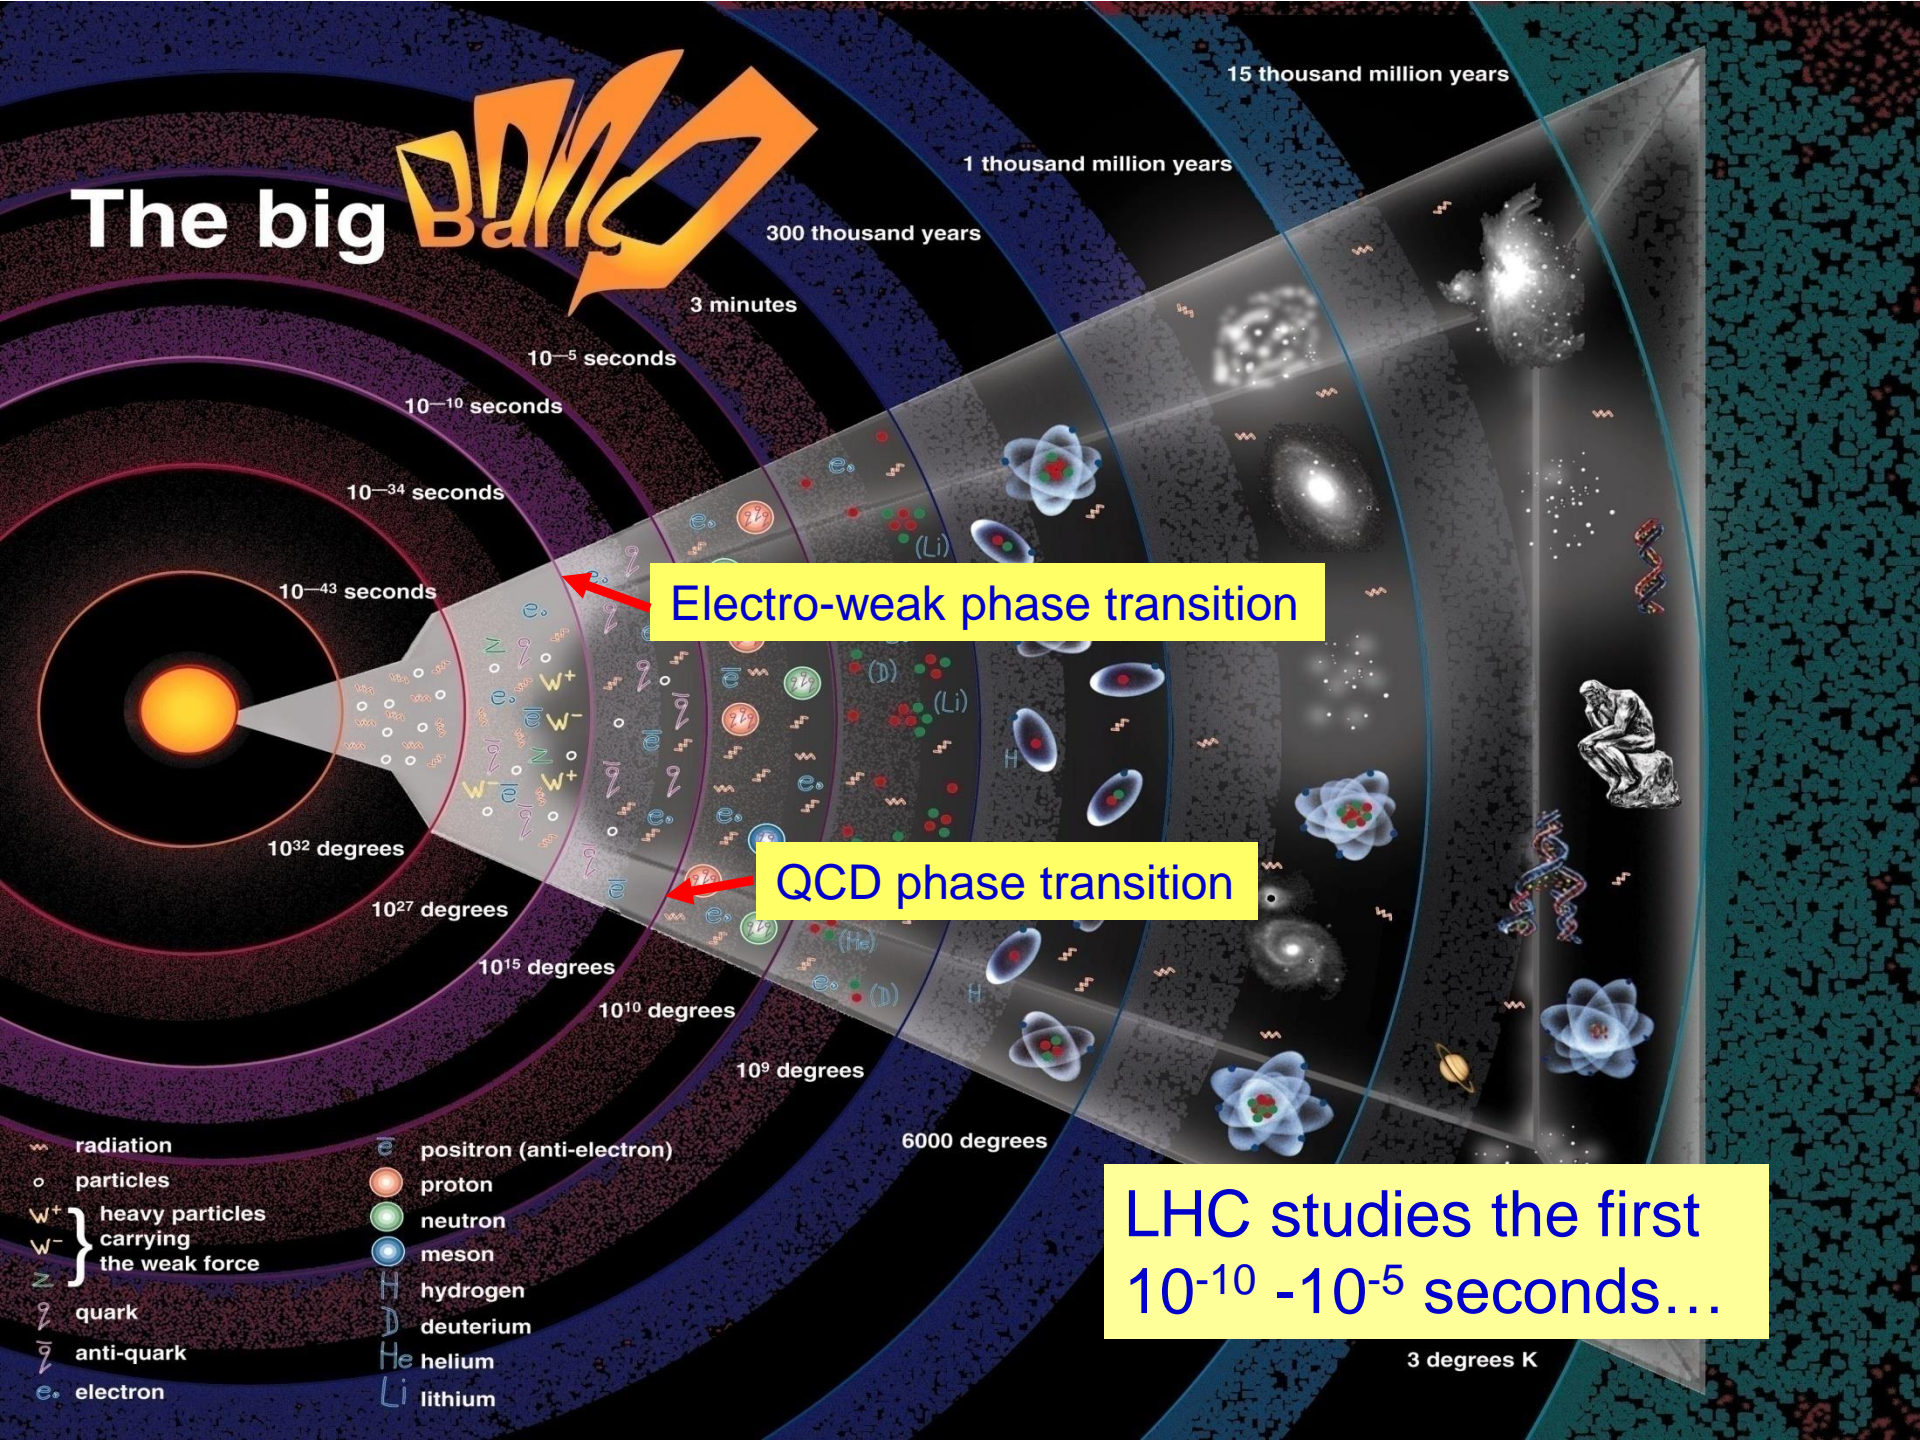

- Around 1950, Livingston made following observation:
  - Plotting energy of accelerator as a function of year of commissioning, on semi-log scale, the energy gain has linear dependence.
- Observations today:
  - Exhibition of saturation effect:
    - New technologies needed.
  - Overall project cost increased
    - Project cost increased by factor of 200 over last 40 years.
  - Cost per proton-proton  $E_{CM}$  energy decreased by factor of 10 over last 40 years.

# Scientific Challenge:

to understand the very first moments of our Universe  
after the Big Bang

# The big Bang

Elements of the Standard Model

# Nobel Prize in Physics 2013

The Nobel Prize in Physics 2013 was awarded jointly to François Englert and Peter W. Higgs *"for the theoretical discovery of a mechanism that contributes to our understanding of the origin of mass of subatomic particles, and which recently was confirmed through the discovery of the predicted fundamental particle, by the ATLAS and CMS experiments at CERN's Large Hadron Collider"*.

---

# Open Issues in Particle Physics

- Complete understanding of Higgs boson properties.
- Why are there so many types of matter particles?
- What is the cause of matter-antimatter asymmetry?
- What are the properties of the primordial plasma?
- What is the nature of the invisible dark matter?
- Can all fundamental particles be unified?
- Is there a quantum theory of gravity?

*The present and future accelerator-based experimental programmes at colliders will address these questions and may well provide definite answers.*

---

# Accelerator Parameters (I)

Particle colliders designed to deliver two basic parameters to HEP user.

I. Centre-of-Mass Energy  $E_{\text{CM}}$

$$E = mc^2 = \gamma m_0 c^2$$

Higher energy produces more massive particles.

When particles approach speed of light, they become more massive but not faster.

# Why Colliders?

Fixed-target

Only a tiny fraction of energy converted into mass of new particles  
(due to energy and momentum conservation)

Colliders

Entire energy converted into the mass of new particles

# De Broglie Wavelength

# Accelerator Parameters (II)

Particle colliders designed to deliver two basic parameters to HEP user.

## II. Luminosity

- Measure of collision rate per unit area.
- Event rate for given event probability (“cross-section”):

$$R = \mathcal{L} \sigma$$

For a Collider, instantaneous luminosity  $\mathcal{L}$  is given by

$$\frac{N_+ N_- f_c}{4\pi \sigma_x^* \sigma_y^*}$$

- → Require intense beams, high bunch frequency and small beam sizes at IP.

# Cross-sections at the LHC

“Well known” processes. Don’t need to keep all of them ...

**New Physics!!**  
We want to keep!!

# High-field Accelerator Magnets

- Magnetic rigidity  $B \rho$  used to describe motion of relativistic particle of charge  $e$  and momentum  $p$  in magnetic field of strength  $B$  and bending radius  $\rho$

$$B \rho = p / e \text{ (in SI units)}$$

$$B \rho [\text{T.m}] \sim 3.3356 p [\text{GeV}/c]$$

- Two approaches for raising collision energy:
  - Increase magnetic field of bending magnets.
  - Increase ring circumference and hence radius  $\rho$ .
- Final focus Quadrupoles

$$B L_q \approx 1 / \sigma^*$$

- Design quadrupoles for largest integrated field  $B L_q$  to obtain smallest beam size  $\sigma^*$  at IP.

# Varying the SCRF Frequency

---

# Collider Types

- **Hadron Colliders**

- Desire high energy

- Only ~10% of beam energy available for hard collisions producing new particles

- Need  $O(10 \text{ TeV})$  Collider to probe 1 TeV mass scale.
- High-energy beam requires strong magnets to store and focus beam in reasonable-sized ring.

- Desire high luminosity

- Use proton-proton collisions.

- High bunch population and high bunch frequency.

- Anti-protons difficult to produce if beam is lost

- *c.f.* SPS Collider and Tevatron
-

# Collider Types

## ■ Lepton Colliders (e+e-)

- Synchrotron radiation - most serious challenge for circular colliders
  - Energy loss of a particle per turn

$$U_0 = \frac{4\pi}{3} \frac{r_e \gamma^4}{R} mc^2$$

- Emitted power in circular machine is

$$P_{SR}[\text{kW}] = \frac{88.5 E^4[\text{GeV}] I[\text{A}]}{\rho[\text{m}]}$$

- For collider with  $E_{\text{CM}} = 1 \text{ TeV}$  in the LHC tunnel with a 1 mA beam, radiated power would be 2 GW
  - Would need to replenish radiated power with RF
  - Remove it from vacuum chamber
- Approach for high energies is Linear Collider.

# Collider Characteristics

## ■ Hadron collider at the frontier of physics

- Huge QCD background
- Not all nucleon energy available in collision

## ■ Lepton collider for precision physics

- Well defined initial energy for reaction
- Colliding point like particles

ATLAS  $Z \rightarrow \mu\mu$  event from 2012 data with 25 reconstructed vertices

Simulation of HIGGS production  $e^+e^- \rightarrow Z H$   
 $Z \rightarrow e^+e^-$ ,  $H \rightarrow bb$

# Collider Characteristics

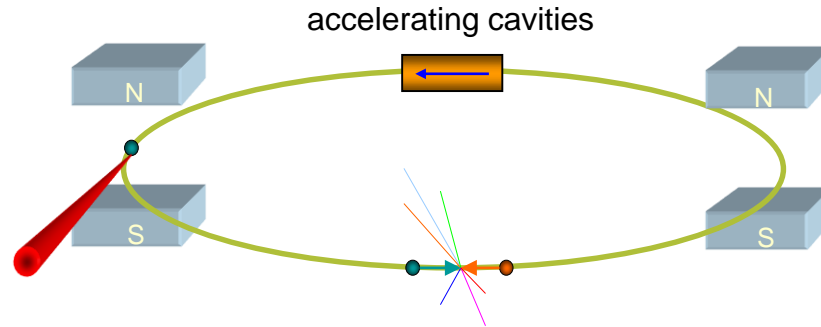

8 orders of Magnitude!

**pp collisions:**  
Interesting events need to be found in a huge number of collisions

**$e^+e^-$  collisions:**  
More "clean", all events usable

# Circular versus Linear Collider

## Circular Collider

many magnets, few cavities, stored beam  
higher energy  $\rightarrow$  stronger magnetic field  
 $\rightarrow$  higher synchrotron radiation losses ( $E^4/m^4R$ )

## Linear Collider

few magnets, many cavities, single pass beam  
higher energy  $\rightarrow$  higher accelerating gradient  
higher luminosity  $\rightarrow$  higher beam power (high bunch repetition)

---

# A Global Strategy

- Encourage strategic studies and planning of international facilities for particle physics in different regions of the world
    - ILC in Japan
    - CEPC/SPPC in China
    - CLIC/FCC in Europe
    - LBNF in US (neutrinos & the intensity frontier)
  - Encourage global coordination in planning future energy frontier colliders
    - ILC and CLIC groups working together
      - Linear Collider Board (and Linear Collider Collaboration) under ICFA
    - FCC and CEPC/SPPC
