 ♥ 40-52-B01 - Salle Bohr (CERN)

"Technical and physiological hazards of static magnetic fields" marco.buzio@cern.ch MAGNETIC MEASUREMENT SECTION cern.ch/mm

2/38

How dangerous are magnetic fields ?

• Every year electricity kills 200 in France alone, vs. 2/3 deaths due magnetic field worldwide

... however:

- Exposure to magnetic fields is exponentially lower, outside of certain communities (Magnetic Resonance Imaging, High Energy Physics, plasma physics, spectroscopy ...)
- Everyone is familiar with electricity; magnetic field quantities are baffling to most
- Unlike electric fields, magnetic fields penetrate freely the human body and everything else Passive shielding of large volumes/strong fields is impractical to impossible

 Seminar on Non-Ionising Radiation (NIR)

 Image: Tuesday 14 May 2019, 09 00 → 12.15 Europe/Zurich

 40-52-801 - Salle Bohr (CERN)

"Technical and physiological hazards of static magnetic fields" 3/38 marco.buzio@cern.ch

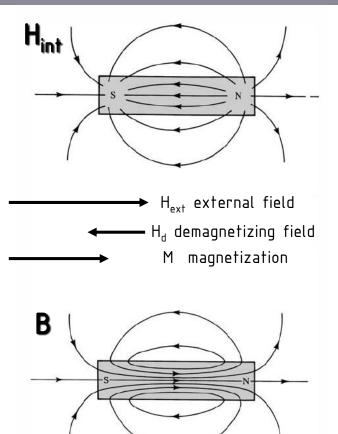

What can possibly go wrong ?

Magnetic forces 1/3

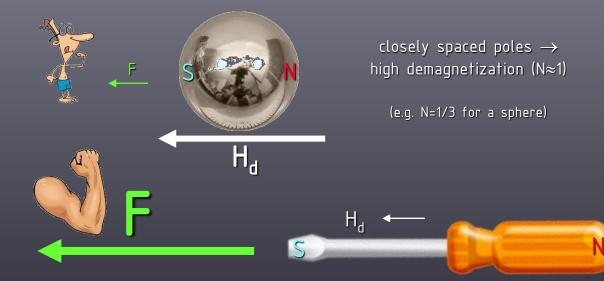

H field (*irrotational i.e.* $\nabla \times H = J + \partial D / \partial t = 0$) Pole-to-pole field lines Goes $N \rightarrow S$ both inside and outside

B field (solenoidal i.e. $\nabla \cdot B = 0$) Closed field lines Goes $N \rightarrow S$ only outside

 $H=H_{ext}+H_{d'}$ $H_{d}=-NM$ *N*=*demagnetization factor* ($0 \le N \le 1$, function of shape)

$$M = \boldsymbol{\chi} H = \frac{\boldsymbol{\mu}_r - \mathbf{1}}{1 + N(\boldsymbol{\mu}_r - \mathbf{1})} H_{ext} \quad [A/m]$$

widely spaced poles \rightarrow low demagnetization (N \approx 0)

force per unit volume is much stronger on elongated objects

HSF

MAGNETIC MEASUREMENT SECTION

cern.ch/mm

5/38

Magnetic forces 2/3

Case of uniform field

(e.g. inside a dipole or solenoid; Earth field on a local scale)

- \cdot Magnetization \rightarrow N and S poles arise
- · Opposite magnetic poles attract
- \cdot Equal and opposite forces ightarrow torque

$$T \approx \frac{1}{N} \frac{B^2 \mathcal{V}}{\mu_0} \sin \theta \, \cos \theta$$

magnetic torque for an <u>elongated</u> ferromagnetic object of volume V

magnetic objects align to the field lines

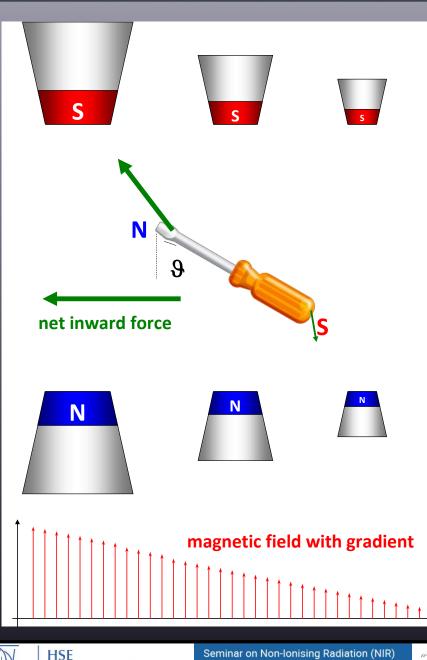

6/38

uniform magnetic field

HSE Occupational Health & Safety and Environmental Protection Unit "Technical and physiological hazards of static magnetic fields" marco.buzio@cern.ch MAGNETIC MEASUREMENT SECTION

Magnetic forces 3/3

Case of field with gradient: (e.g. fringe field of large magnets)

- Magnetic forces depend upon position and orientation of the piece
- Net force appears in addition to the torque

$$F_z \approx \left(2 + \frac{\cos^2 \vartheta}{N}\right) \frac{\mathcal{V}B}{\mu_0} \frac{\partial B}{\partial z}$$

magnetic force for an elongated ferromagnetic object of volume V

NB: force grows with B^2 i.e. $l^2_{excitation}$

ferromagnetic objects are pulled towards regions of stronger field

7/38

Tuesday 14 May 2019, 09:00 → 12:15 Europe/Zurich and Environmental Protection Unit 9 40-S2-B01 - Salle Bohr (CERN)

Occupational Health & Safety

"Technical and physiological hazards of static magnetic fields" marco.buzio@cern.ch

Magnetic forces on steel tools

Uniform field in the gap Tools <u>align</u> to field lines

- HYDRO SYSTEM SA 8, Rue de la Bergère, 1217 MEYRIN, CH
 - **EGA Master SA** C/Zorrolleta 11 (01015), Vitoria, ES

Field rolls off outside the gap Tools get <u>pulled inside</u>

Solution: non-magnetic tools

8/38

Recommended limit for using standard tools: (Directive 2013/35/EU) Background field $B \leq 3 \text{ mT}$ if source $\geq 100 \text{ mT}$

B

"Technical and physiological hazards of static magnetic fields" marco.buzio@cern.ch

MAGNETIC MEASUREMENT SECTION Material classification respect to safety

- \cdot Non-magnetic and weakly magnetic ($\mu_r \approx$ 1-10)
 - Elements: aluminum, copper, titanium, tungsten
 - Bronze, brass, beryllium copper, aluminum bronze
 - Austenitic + high Ni/Cr/Mo stainless steels e.g. 316 $(\mu_r \approx 1 \text{ only after annealing})$
 - Virtually all polymers and glasses, most ceramics

• Strongly magnetic ($\mu_r \approx 10-10000$)

- Ferromagnetic elements: Fe, Ni, Co
- Low-C (soft) e.g. ARMCO steel
- Ferritic (e.g. 409) and martensitic (e.g. 420) stainless steels
- Most other steel types
- NiFe alloys e.g. permalloy, mumetal (μ_r up to ~10⁶)
- Ferrites (Mn/Ni/Zn ceramics)

Permanent magnets

- Ferrites ($B_r \leq 0.35$ T)
- AlNiCo ($B_r \leq 1.2$ T)
- **Rare-earth ceramics e.g. NdFeB, SaCo** ($B_r \le 1.5$ T)

"Technical and physiological hazards of static magnetic fields" 10/38 marco.buzio@cern.ch

Collision hazard examples 1/2

Relatively common accidents in the MRI (Magnetic Resonance Imaging) field.

First fatality on record: Michael, 6, killed by an O_2 bottle in New York, 2001

Worst case at CERN: LEP's L3 0.5 T magnet (currently in ALICE) <u>none injured</u>.

MAGNETIC MEASUREMENT SECTION

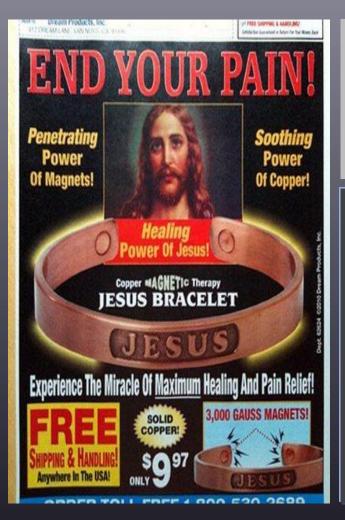

Part 2 Health Hazards

HSE Occupational Health & Safety and Environmental Protection Unit "Technical and physiological hazards of static magnetic fields" 16/38 marco.buzio@cern.ch

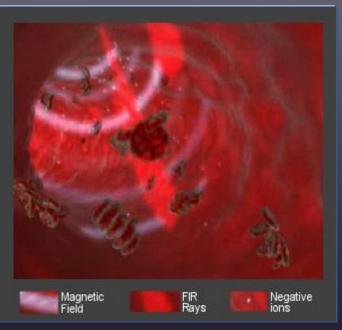

Magnetic field and human health

- Magnetic therapy: many interesting applications found online...
- Most advertised effect is blood supply increase is it true ?

"When blood flows through this magnetic field, the blood cells spin then separate from each other giving each cell more surface area to carry much more oxygen and vital nutrients. The magnetic field also widens your blood vessels allowing more blood to flow through.

The second benefit comes from Germanium which emits negative ions (also known as "Air Vitamins") and Far Infra-Red Rays (also known as "Growth Rays")"

"Technical and physiological hazards of static magnetic fields" 17/38 marco.buzio@cern.ch

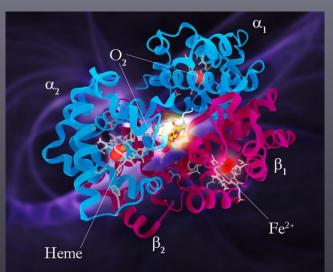

Magnetic forces on biological tissues

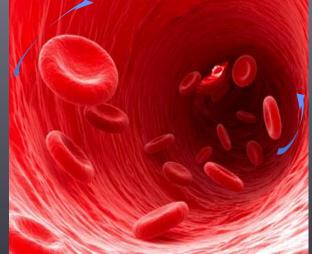

- Magnetite crystals in many animal and human tissues (possible role as sensors e.g. for homing)
- Iron in the blood: ~3 g (red cells) ~1 g (ferritin)
 (typical adult male values)
 isolated atoms, no ferromagnetic domains → small forces

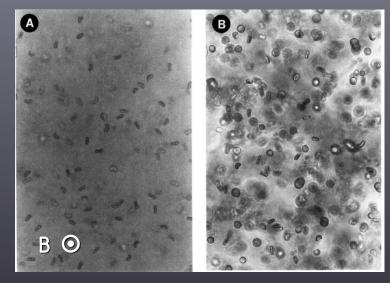

Magnetite crystals in human cerebellum and magnetotactic bacteria

Haemoglobin with 4× Heme groups $\mu_r \,\approx\, 1{+}3.5{\times}10^{-6}~(\text{venous})~,~1{-}6.6{\times}10^{-7}~(\text{arterial})$

Other interaction mechanisms

Free radical chemistry

Vast class of reactions involving highly reactive species with unpaired electrons as intermediate products. The rates of certain radical pair-recombination reactions may change $2\times$ due to magnetic fields. However, <u>no known biochemical reaction meets</u> the necessary requisites in humans

(one exception observed in a type of photosynthetic bacteria)

- DNA damage, altered gene expression possible carcinogenic effects investigated in vitro, animal models and humans
- Resonant effects on redox processes

 (e.g. respiration, photosynthesis)
 Some authors report metabolic stimulation linked to certain types of magnetotherapy (e.g. bone repair)

very subtle effects, inconsistent experimental evidence no reason to believe in a health hazard

EU SCENHIR, Possible effects of Electromagnetic Fields (EMF) on Human Health , 2007

Epidemiological evidence

Large body of evidence from MRI community:

- 0.5~3.0 T widespread, up to 7 T commercially available
- 300+ M scans since 1985, 35 M scans/year
- no long term/delayed effects observed

patient/occupational exposure deemed safe up to 8 T

full-body MRI up to 9.4 T ongoing, 11.7 T coming soon

small vertebrates routinely tested up to 21 T

no harm reported even at those levels

Zaremba, Guidance for magnetic resonance diagnostic devices- criteria for significant risk investigations. U.S. CDRH, FDA, and DHHS. Issued July 14, 2003

"Technical and physiological hazards of static magnetic fields" 22/38 marco.buzio@cern.ch

Effects of quasi-static magnetic fields 1/2

- Field change in a conducting medium (ppprox1 Ω m) ightarrow induced voltage ightarrow eddy currents
- dB/dt \geq 2 T/s \rightarrow excitation of nerves (E \geq 6 V/m, J \geq 10 nA/mm²) and muscles (Δ V \geq 40 mV)
- Possible effects on the peripheral nervous system:

Headache/dizziness

(caused by differential magnetic susceptibility of vestibular tissues: $46 \text{ T}^2/\text{m} \rightarrow 1\%$ g perceived)

Sour/metallic taste feeling

(felt by 15% of subjects, caused by eddy currents on the tongue. Effect weaker if the mouth is kept open)

Magnetophosphenes

(flickering light spots caused by the excitation of the retina or the optical nerve)

Subjective and reversible effects reported by ~50% personnel in ATLAS/CMS when magnet ON

reed switch \sim external field \rightarrow magnetization and closure of contacts

Pacemakers

- Pacemaker function: <u>sense</u> electrical cardiac pulses, <u>provide missing pulses</u> at suitable intensity and rate
- Certain older models include a **reed switch** that can be magnetically actuated from outside to:
 - go into programming mode
 - disable pulse sensing and go into fixed-frequency mode (asynchronous pacing)
- competing rhythms may cause discomfort, arrhythmia, or in extreme cases death (17 fatalities on record to date)
- Lowest reported DC activation threshold is 0.7 mT
- AC fields may further interfere with pulse detection/generation electronics (MRI gradient coils may drive heartbeat !)

pacemakers, defibrillators (ICD) or any other heart implant: exposure to **B** > 0.5 mT is absolutely forbidden

HSE S Occupational Health & Safety and Environmental Protection Unit

"Technical and physiological hazards of static magnetic fields" 27/38 marco.buzio@cern.ch

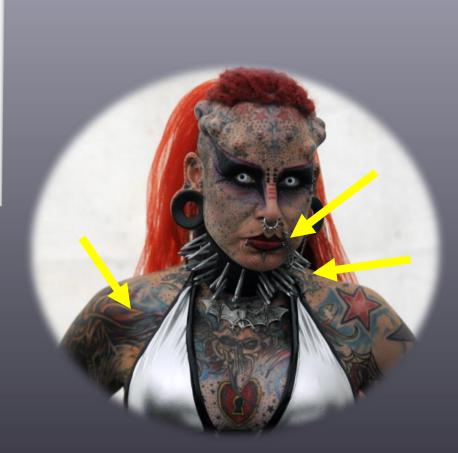

Can you go in a strong magnetic field if you have ?

mostly YES (but: magnetic overdentures exist)

STAY AWAY !!

not recommended (esp. < 3 months)

respect the 10 mT boundary or bring it up with the medical service !
