

EGEE-III Summary

Bob Jones – Project Director - CERN

EGEE-III final review (CERN)

23-24 June 2010

- **Project**

- Programme of Work completed - all deliverables produced and milestones achieved
- Financial and effort consumption as foreseen
- Key project metrics achieved or surpassed
- Recommendations from the first review have been implemented
- **Key added value of EGEE-III has been to provide continuous high quality operation of a European grid which has doubled in scale and served a wider user base while at the same time transforming its organization and processes for a transition to a federated model based on NGIs**

- **Infrastructure**

- Scale of infrastructure increased (sites, countries, diversity of user communities)
- Improved Quality of Service resulting from better monitoring and operational procedures
- Operational procedures and tools revised to accommodate move from ROCS to NGIs

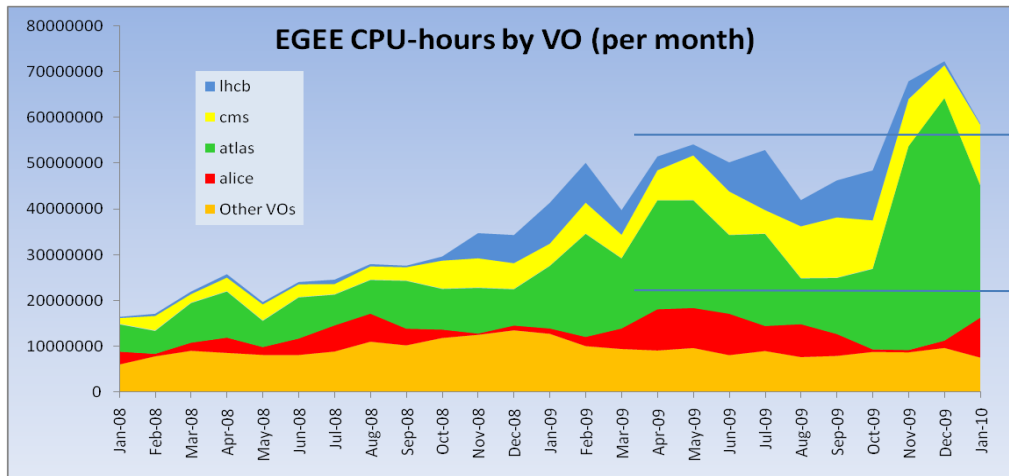

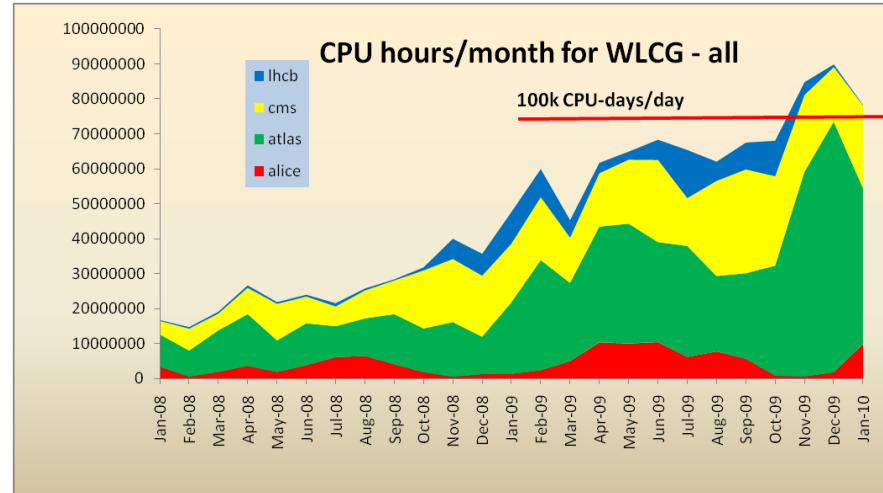

- **Middleware and interoperability**

- Ensured continued support of middleware to match increased deployment and usage
- Deployed interoperability with other middleware stacks, notably ARC & UNICORE
- Initial deployment of new security infrastructure – ARGUS
- Revised software process

- **Usage of the infrastructure**

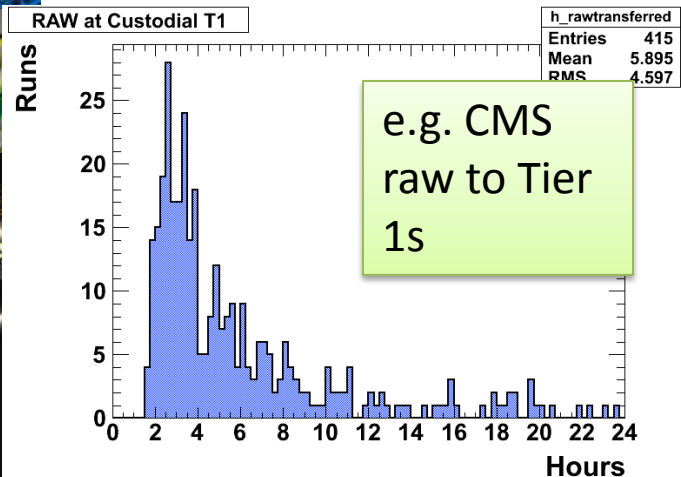

- Overall CPU usage has significantly increase
- All supported disciplines have increased the breadth of applications deployed
- **With EGEE, scientists are able to do more work, on a larger scale, and get results in a shorter time frame. EGEE has formed collaborations within Europe and world-wide, and allowed Europe to collaborate as a whole with other regions. These collaborations will last for years to come.**

WLCG uses EGEE & OSG

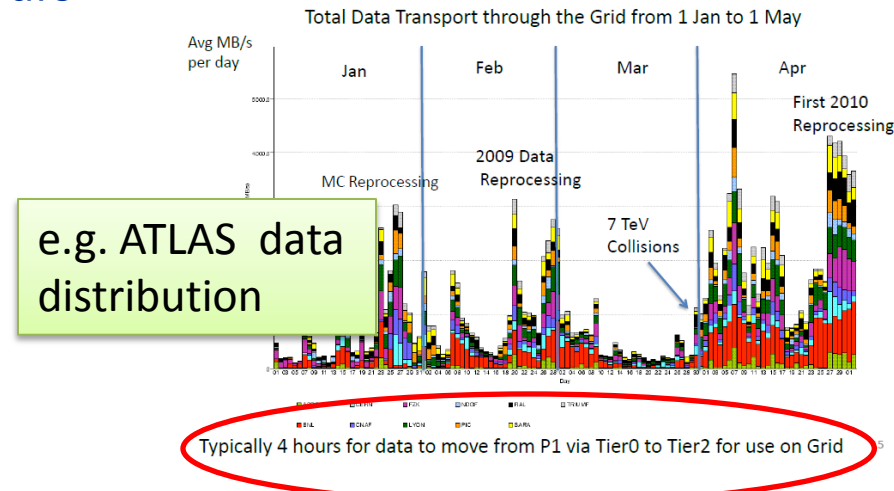

Readiness of the Computing

- Data reaches Tier 2s within hours

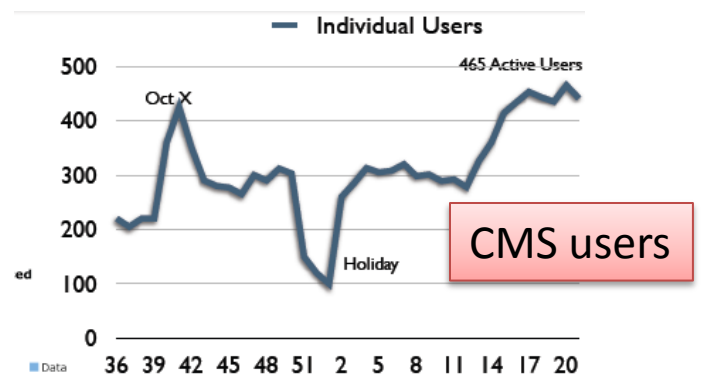

Worldwide Data Distribution

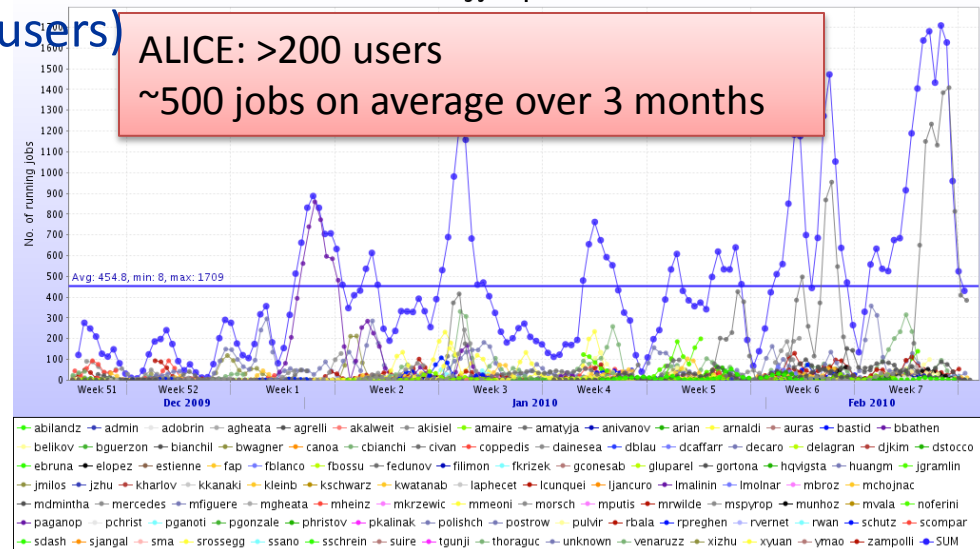

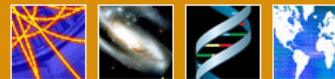

- Increasing numbers of (analysis users)

- E.g.: ~500 grid users in each ATLAS/CMS; ~200 in ALICE

Running jobs per user

Q&A: Peer-reviewed physics, at the speed of light

Sergio Bertolucci is the director for research and computing at CERN. Over the noise of nearby cathedral bells chiming the hour, iSGTW caught up with him on the steps of the University Building in Uppsala during a coffee break at the EGEE User Forum. We asked him about the spate of new papers coming out from the LHC, and what it all means for science.

iSGTW: *We have heard that a lot of papers have already been published in the time since the start-up of the LHC. Is that right?*

Bertolucci: Four papers on high-energy physics have already published, and 15 are in preparation as of today, April 14, all based on the collisions that just happened.

One week after the first collisions, the first papers were published electronically. And these were all peer-reviewed.

iSGTW: *That's very fast, compared to the sometimes years-long process of traditional print journals. How was the peer-review done?*

Bertolucci: Each experiment is not a monolith, but consists of 3,000 people working in teams on separate projects within it. When a paper is about to be produced, it passes through different teams for internal review, then is reviewed by teams on other experiments, then reviewed by CERN. So, there have been five layers of review before it even goes to the external publication, which has its own, independent review system. The whole system sounds complex, but nonetheless is fast, as seen by one week between observation and publication.

iSGTW: *Where have these papers appeared?*

Bertolucci: Open-access journals, such as the [Journal of High Energy Physics](#). Our paradigm has always been open access, and this is a good place to practice it.

iSGTW: *What was the content of what was published?*

Bertolucci: For one thing. The number of charged particles per unit angle at different

CERN sets date for first attempt at 7 TeV collisions in the LHC PROB.10 23.03.2010

Geneva, 23 March 2010. With beams routinely circulating in the Large Hadron Collider at 3.5 TeV, the highest energy yet achieved in a particle accelerator, CERN has set the date for the start of the LHC research programme. The first attempt for collisions at 7 TeV (3.5 TeV per beam) is scheduled for 30 March.

"With two beams at 3.5 TeV, we're on the verge of launching the LHC physics programme," explained CERN's Director for Accelerators and Technology, Steve Myers. "But we've still got a lot of work to do before collisions. Just lining the beams up is a challenge in itself: it's a bit like firing needles across the Atlantic and getting them to collide half way."

Between now and 30 March, the LHC team will be working with 3.5 TeV beams to commission the beam control systems and the systems that protect the particle detectors from stray particles. All these systems must be fully commissioned before collisions can begin.

"The LHC is not a turnkey machine," said CERN Director General Rolf Heuer. "The machine is working well, but we're still very much in a commissioning phase and we have to recognize that the first attempt to collide is precisely that. It may take hours or even days to get collisions."

The last time CERN switched on a major new research machine, the Large Electron Positron collider, LEP, in 1989 it took three days from the first attempt to collide to the first recorded collisions.

The current LHC run began on 20 November 2009, with the first circulating beam at 0.45 TeV. Milestones were quick to follow, with twin circulating beams established by 23 November and a world record beam energy of 1.18 TeV being set on 30 November. By the time the LHC switched off for 2009 on 16 December, another record had been set with collisions recorded at 2.36 TeV and significant quantities of data recorded. Over the 2009 part of the run, each of the LHC's four major experiments, ALICE, ATLAS, CMS and LHCb recorded over a million particle collisions, which were distributed smoothly for analysis around the world on the LHC computing grid. The first physics papers were soon to follow. After a short technical stop, beams were again circulating on 28 February 2010, and the first acceleration to 3.5 TeV was on 19 March.

Once 7 TeV collisions have been established, the plan is to run continuously for a period of 18-24 months, with a short technical stop at the end of 2010. This will bring enough data across all the potential discovery areas to firmly establish the LHC as the world's foremost facility for high-energy particle physics.

A webcast will be available on the day of the first attempt to collide protons at 7TeV. More details will be available at: <http://press.web.cern.ch/press/lhc-first-physics/>

LHCC Referees...

- *"First experience of the World-wide LHC Computing Grid (WLCG) with the LHC has been positive. This is very much due to the substantial effort invested over several years during the intensive testing phase and all Tier centres must take credit for this success. The LHCC congratulates the WLCG on the achievements."*

May 2010

WLCG: Experience from Real Data Taking

20

"Over the 2009 part of the run, each of the LHC's four major experiments, ALICE, ATLAS, CMS and LHCb recorded over a million particle collisions, which were distributed smoothly for analysis around the world on the LHC computing grid. The first physics papers were soon to follow."

- **Dissemination, outreach & training**
 - 4 major international events organised each with more than 500 participants
 - Very high media profile maintained over two years
 - More than 200 scientific journal papers published
 - 185 training events organised in 29 countries with more than 2300 participants
 - Engagement with ESFRI projects intensified
 - Websites audited to ensure material remains “timeless” and continuously available

- **Sustainability**
 - Formation of gLite Open Collaboration for continued support and development of the middleware stack
 - EGEE and gLite trademarks registered for a further 5 years
 - JRUs laid the foundations for NGIs
 - Transition to EGI has been made
 - EGEE’s infrastructure, procedures, tools, middleware and personnel forms the foundation of EGI
 - Many deliverables include “lessons learnt” and additional material produced to ensure the experience gained during EGEE can be re-used by future projects and initiatives

The road towards EGI		
2001	January	European Data Grid project is launched
2004	April	EGEE begins
2006	May	EGEE-II takes over from EGEE
2007	September	EGI_DS begins
2008	May	EGEE-III begins
	December	EGI_DS releases 'Blueprint for a European Grid Infrastructure'
2009	March	EGI_DS policy board decide Amsterdam will host EGI.eu
	July	EGI council is created based around a Memorandum of Understanding
2010	8 February	EGI.eu is founded
	1 May	EGI.eu assumes coordination of European Grid Infrastructure, supported financially by NGIs, EIROs and the EC through the EGI-InSPIRE project
2014		EGI-InSPIRE ends, EGI.eu continues to coordinate EGI
