Outline

- **Motivation**
- **Surrogate-reaction Method**
 - **Validity**
- **Experiments in Direct Kinematics**
 - **Experimental setup**
 - **Technical limitations**
- **Moving to Inverse Kinematics at Storage Rings**
 - **Proposed experimental setup**
 - **Simulations**
- **Solar Cells as Heavy Ion Detectors**
 - **Advantages**
 - **Compability with SR environment**
 - **Response to heavy ions ($E > 1 \text{ MeV/u}$)**

Motivation

The study of neutron-induced fission and capture cross sections of **short-lived nuclei** is very important to many domains

- **Nuclear astrophysics**
understanding the origin of the elements
- **Reactor physics**
development of more efficient reactors
- **Medical applications**

Often cross sections are **very difficult or even impossible to measure** due to the **high radioactivity of the targets involved!**

Surrogate Reaction Method

J. Cramer and H. Britt, Nucl.Sci.Eng. 41 (1970)

Production of the ion of interest through an **alternative reaction** to overcome the difficulties to **produce and manipulate** radioactive isotopes

$$\sigma_{n,decay}^A(E^*) = \underbrace{\sigma_{CN}^{A+1}(E^*)}_{\substack{\text{Theory} \\ \text{Optical model}}} \cdot \underbrace{P_{decay}^{surro}(E^*)}_{\text{Experiment}}$$

Surrogate Reaction Method - Validity

Neutron-induced and surrogate reaction must lead to the formation of a compound

$$\sigma_{n,decay}^A(E^*) = \sigma_{CN}^{A+1}(E^*) \cdot P_{decay}^{surro}(E^*)$$

The decay only depends on E^* , J and π !

In addition, $P_{decay}^{surro}(E^*) = P_{decay}^n(E^*)$

At a limit:

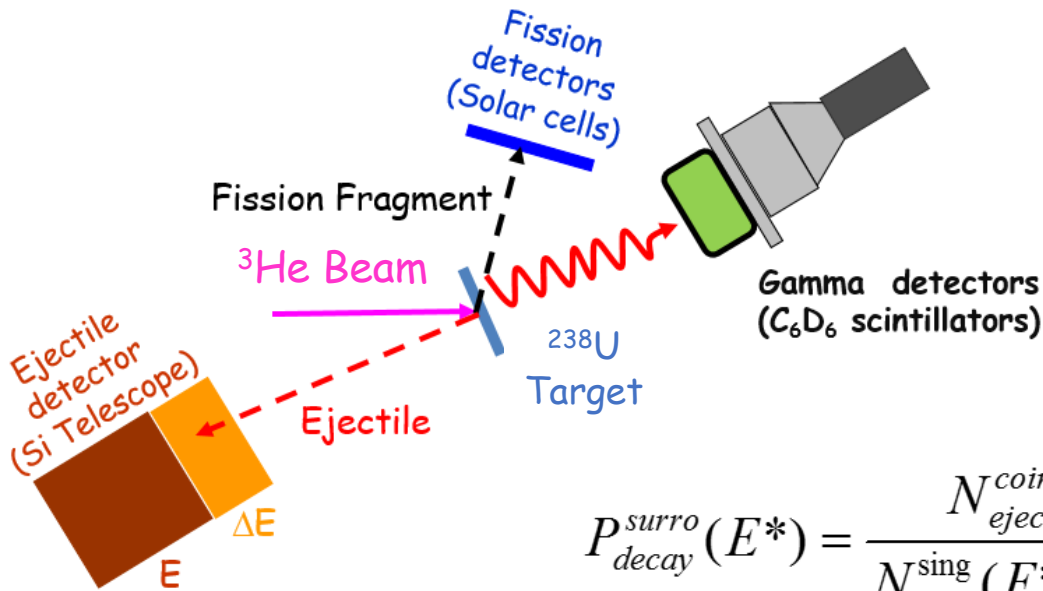

- The populated J and π distributions are equal
- The decay is independent of J and π (Weisskopf-Ewing limit valid at high E^*)

Validity determined a posteriori

Data obtained with the surrogate method need to be compared to neutron-induced data

Surrogate Reaction Method - Experiment

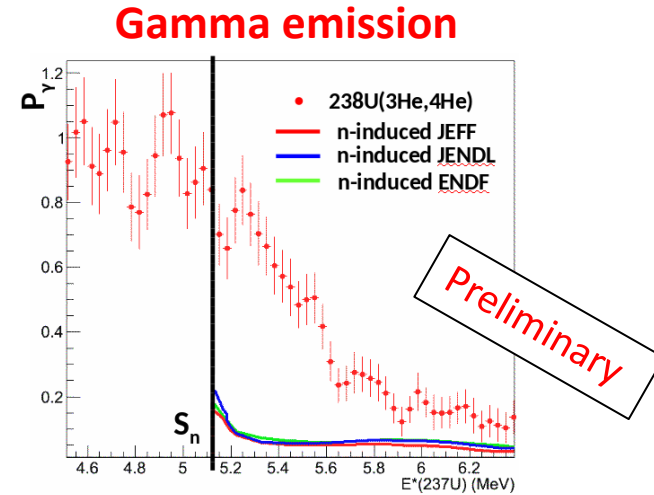

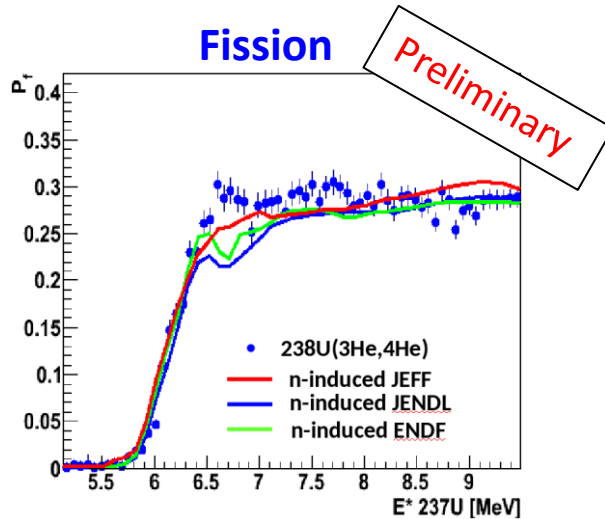

Simultaneous measurement of fission and γ -decay probabilities

$$P_{decay}^{surro}(E^*) = \frac{N_{ejec-decay}^{coin}(E^*)}{N_{ejec}^{sing}(E^*) \cdot \epsilon_{decay}(E^*)}$$

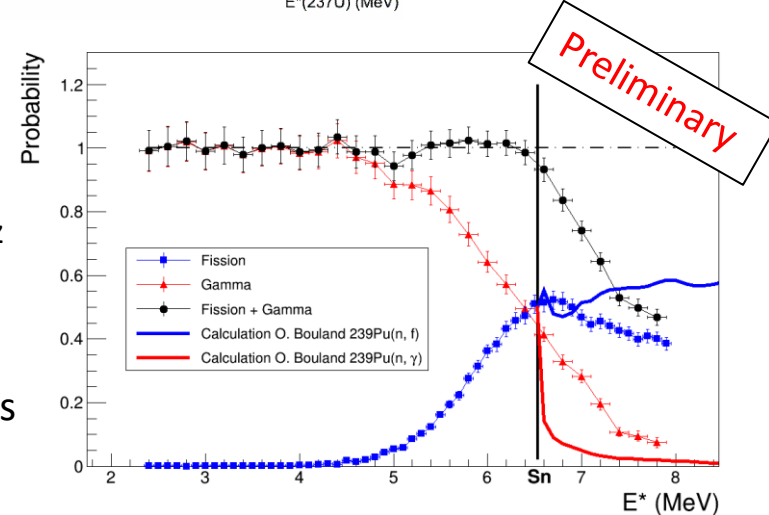

Surrogate Reaction Method - Results

Comparison to neutron-induced calculations

PhD thesis of R. Perez-Sanchez

Even-even nucleus, low density of states near the fission barrier
 Significant **discrepancies** for gamma and fission probabilities

Surrogate Reaction Method

Surrogate Reactions can be use to tune parameters in theoretical models

Step 1: Calculate **spin-parity distributions**

Step 2: Match the experimental surrogate decay probability by tuning the parameters of the **statistical model**

Step 3: Predict the desired **neutron cross-sections**

$$P_{surro,decay}(E^*) = \sum_{J^\pi} P_{surro}^{form}(E^*, J^\pi) \cdot P_{decay}(E^*, J^\pi)$$

Technical limitations of Direct Kinematics

- Unavailability of targets from short-lived nuclei
- High background from target contaminants
- P_γ : low detection efficiency; discrimination of gammas from fission fragments
- P_n : measurement of low-energy neutrons and neutron efficiency

Inverse kinematics

Access to very short-lived nuclei
Detection of heavy residues

Storage Rings

Energy resolution – 100 keV
No target contaminants

Surrogate Reactions at Heavy-ion Storage Rings

- Pure, ultrathin gas target without contaminants
 - Excellent beam energy resolution due to e^- cooling
 - Excellent spatial resolution
- ϵ_{beam} up to $0.05 \text{ mm}\cdot\text{mrad}$

CRYRING @ GSI

Extreme High Vacuum

XHV- 10^{-11} -> 10^{-12} mbar

Surrogate Reactions at Heavy-ion Storage Rings

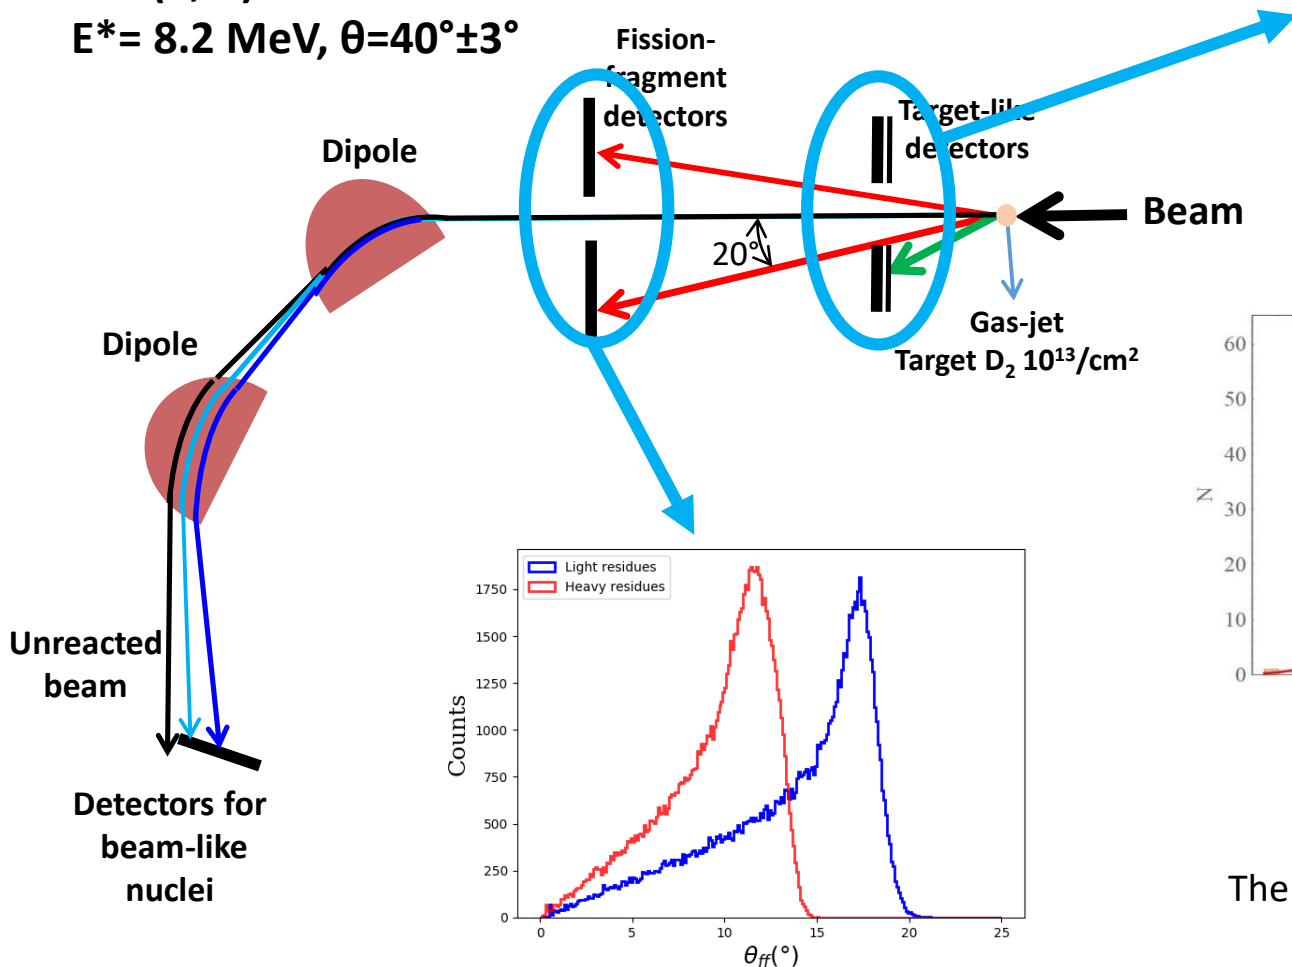

Simultaneous measurement of **gamma**, **neutron**-emission and **fission** probabilities!!

Surrogate Reactions at Storage Rings

Very realistic **simulations** Manfred Grieser – MPIK, Germany

$^{238}\text{U}(d,d')$ at 11 A MeV

$E^* = 8.2 \text{ MeV}, \theta = 40^\circ \pm 3^\circ$

Fission fragments emitted in a 20° cone

E^* resolution of 200-400 keV

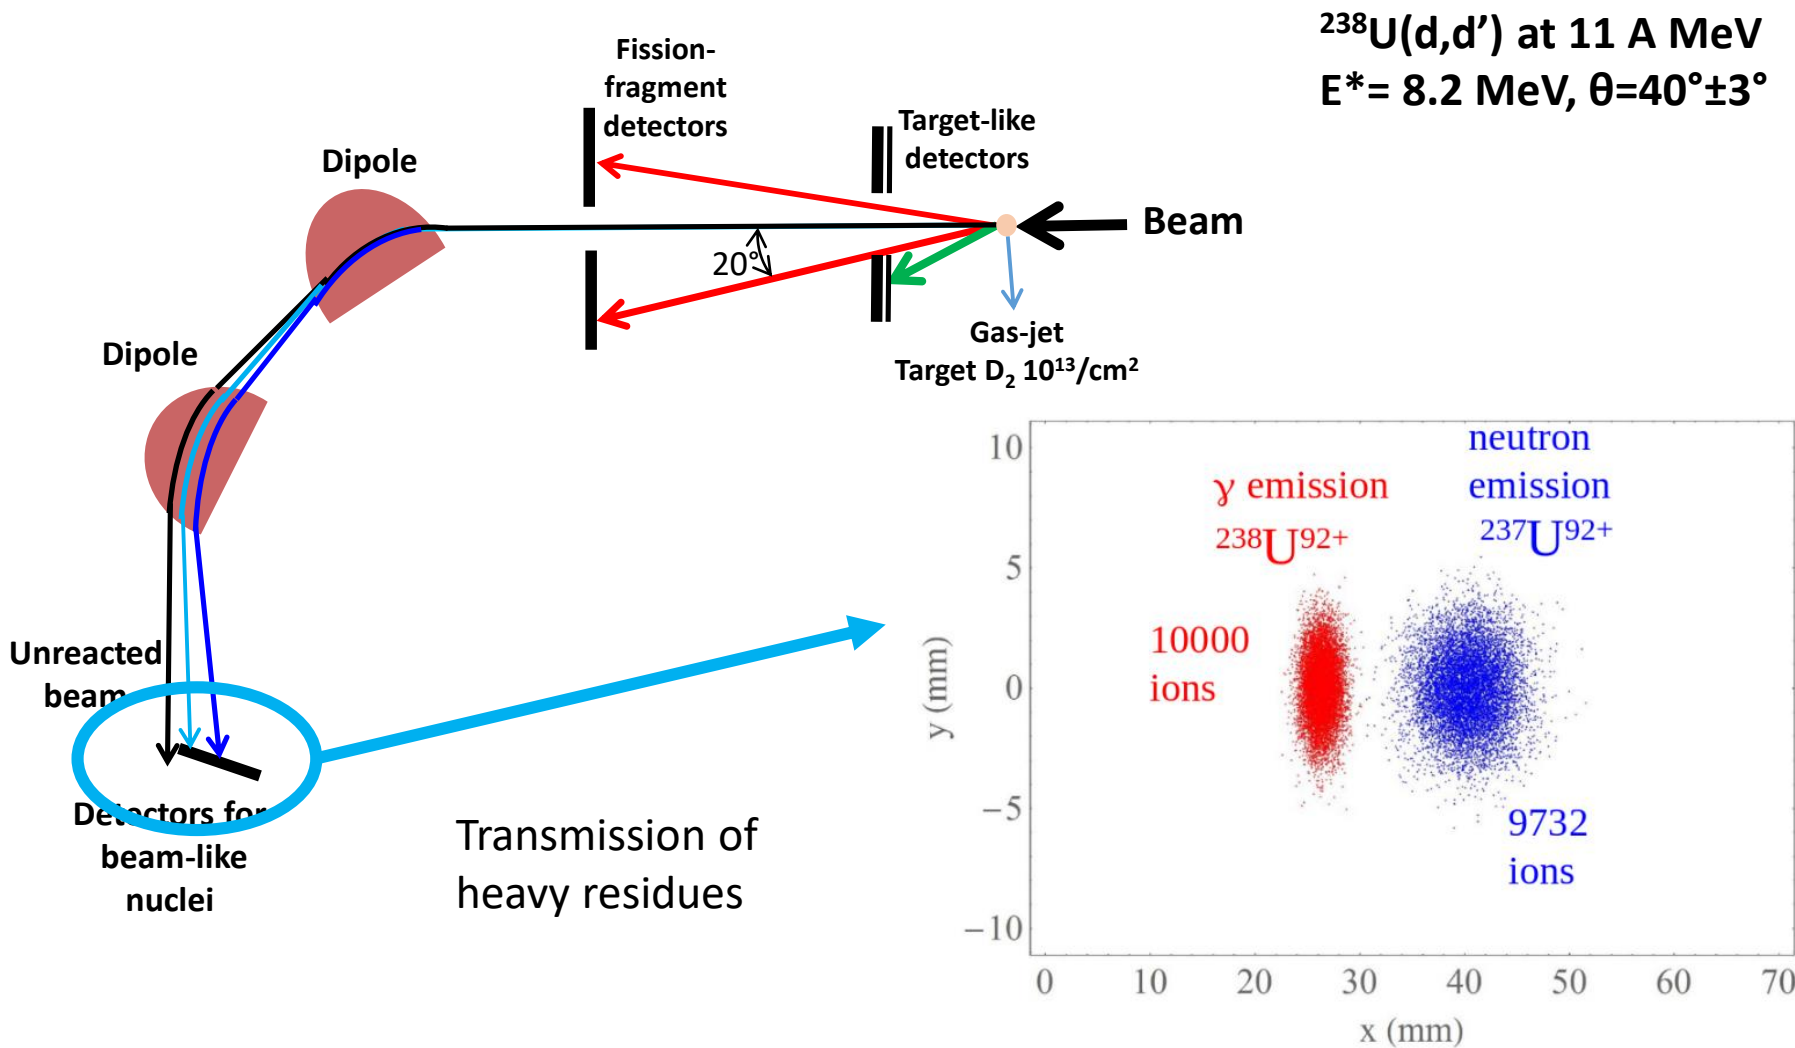

The reconstructed E^* resolution is most limited by the detector resolution.

Surrogate Reactions at Storage Rings

Surrogate Reactions at Storage Rings

Very realistic **simulations** Manfred Grieser – MPIK, Germany

Surrogate Reactions at Storage Rings

Solar Cells -> Heavy ion detectors @ Storage Rings

- Low cost
- Very robust
- Flexible geometry
- Operates without bias voltage
- High radiation damage resistance
- High capacitance $\approx 38 \text{ nF/cm}^2$

NUCLEAR INSTRUMENTS AND METHODS 164 (1979) 437-438, © NORTH-HOLLAND PUBLISHING CO

PHOTOVOLTAIC CELLS AS FISSION PRODUCT DETECTORS

GÜNTER SIEGERT*

Institut Laue Langevin, Grenoble, France

- **Specific pre-amplifiers**
- **Study XHV compability**
 - Outgasing rate $< 5 \cdot 10^{-11} \text{ mbar.l}/(\text{s.cm}^2)$
- **Irratiation of cells**
 - Heavy ions above 1 A MeV

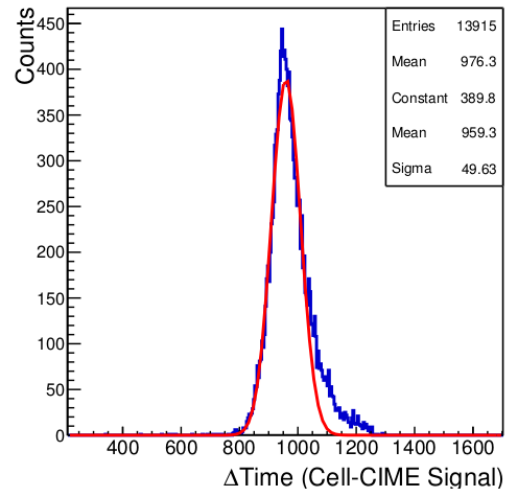

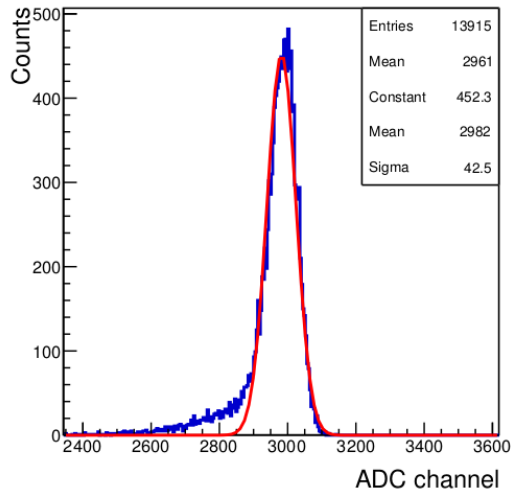

Surrogate Reactions at Storage Rings

Solar Cells -> Heavy ion detectors @ Storage Rings

Experiment @ GANIL, France

^{84}Kr , ^{129}Xe , ^{238}U beams @ 2 to 15 A MeV

5x5 mm² cell at ^{129}Xe at 10 MeV/u

Energy resolution:
2-3 %
Time resolution:
4 ns

Suitable for SR experiments

Conclusions and Outlook

- **Surrogate method** as a promising method to infer neutron-induced cross sections
- An experimental setup was developed at CENBG to **measure simultaneously the gamma emission and fission probabilities**
 - Studies in direct kinematics have opened many questions regarding its direct comparison to neutron induced reactions
 - Surrogate reactions can be very useful to tune model parameters
- Moving to inverse kinematics at **storage rings** will enable to **measure simultaneously the gamma, neutron-emission and fission probabilities** with high quality data
 - We are developing a setup to be used at the **CRYRING@GSI**
 - Some preliminary studies of the $^{238}\text{U}(d,d')$ reaction have indicated efficiencies close to 100%, E^* resolution of 300 keV
- **Solar cells** are foreseen to work as **heavy ion detectors** and we have conducted a series of successful exploratory tests to evaluate their compatibility with the future measurements and the storage ring environment.
